A graph can tell the story of motion

GUIDED NOTES / use with the projected diagram Name _____

A SAY THE WORD

Average velocity / ES: velocidad media / PT: velocidade média

$\bar{v} = \Delta x \div \Delta t$. Carries direction; summarizes a whole interval.

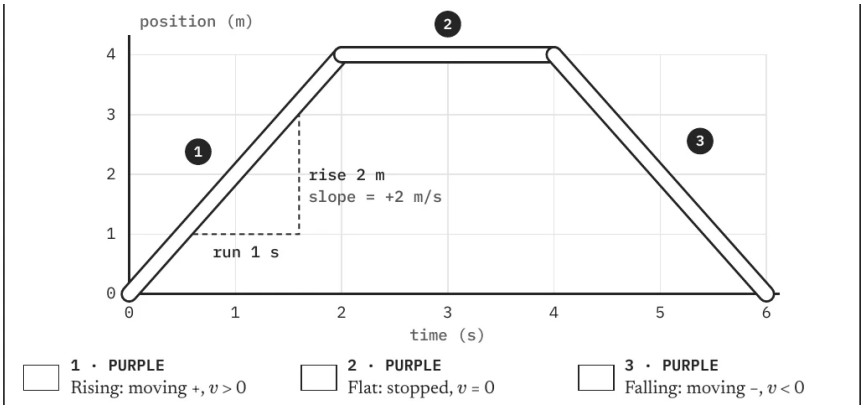

Also on your note page: Average speed, Slope, Instantaneous velocity.

B READ THE RELATIONSHIP

Average velocity = displacement ÷ elapsed time

As you read, find: rise · run · slope.

C TRACE THE ORIGINAL FIGURE

Use the numbered key. Trace one feature. Tell your partner what it means.

D FOLLOW THE WORKED EXAMPLE

A straight x – t line passes through (2 s, 14 m) and (6 s, 6 m). Find the velocity, then predict x at 8 s.

Given (2 s, 14 m) (6 s, 6 m) predict at 8 s

Rule $v = \Delta x \div \Delta t$ $x = x_i + v\,t$

Work $v = (6 - 14) \div (6 - 2)$ x $(8) = 6 + (-2)(2)$

Answer –2 m/s; 2 m if the line continues

E SAVE FOR THE FINAL MEETING

Average velocity, $\Delta x \div \Delta t$ from two tracked positions, is the desk's first estimate of how fast XJ closes in. The slope of its x–t graph shows whether that rate holds.

Read the physics: Average velocity

SUPPORTED READING / read one part, then point to the evidence Name _____

01 PICTURE IT

Find the start and finish on a position–time graph. Read position vertically and time horizontally. A rising line means position increases. A flat line means the object stays in one place.

02 HOW IT WORKS

Divide change in position by elapsed time. The slope is average velocity over that interval. A falling line has negative slope: the object moves toward smaller positions.

03 WHAT TO CHECK

Speed uses total distance. A return trip can have zero average velocity even when the object moved.

04 TRY THE EXAMPLE FROM YOUR NOTES

A straight x – t line passes through (2 s, 14 m) and (6 s, 6 m). Find the velocity, then predict x at 8 s. –2 m/s; 2 m if the line continues.

Model check: Average velocity = displacement ÷ elapsed time.

05 CONNECT TO XJ

Average velocity, $\Delta x \div \Delta t$ from two tracked positions, is the desk's first estimate of how fast XJ closes in. The slope of its x–t graph shows whether that rate holds.

SAY IT BEFORE YOU WRITE

What does the sign of the slope tell you? The line slopes ___. The object moves ___.

Build the word. Draw the idea.

STUDENT CHOICE / FRONT / OPENING MEETING Name _____

A FRAYER MODEL

Average velocity / ES: velocidad media / PT: velocidade média

Say it in any language. Draw or use a few words. Use the notes to check your idea.

Meaning	How can you tell?
To me, average velocity means …	Which two changes do you compare to find average velocity? I divide the change in ___ by the time ___.
Example or sketch	**Non-example**
I see it when …	This looks close, but …

B DRAW WITH YOUR TEACHER

Sketch a falling position–time line. Label the signed rise, positive run and velocity unit.

Labels you can use: rise · run · slope.

Tell a partner: The line slopes ___. The object moves ___.

On assignment: Average velocity

SECTION E / BACK / FINAL MEETING ONLY Name _____

Radar sees XJ at +12 km, then +6 km three seconds later. Positive points away from Earth.

PICK A JOB / DELIVER ONE PRODUCT

☐ **Radar operator**

Send a signed velocity to the tracking console. Mark the two fixes on a sloping line so the next operator can check the sign.

☐ **Traffic broadcaster**

Give viewers a speed and direction. Your producer points at the two readings and asks whether they prove XJ is slowing.

Word bank: rise · run · slope.

Try: “Our desk recommends ___. This mark shows ___.”

One partner makes the graphic; one delivers the first call. Show your evidence to the crew or the audience.

OUR GRAPHIC / COMMAND OR ON-AIR CUE

INCOMING UPDATE / WAIT FOR YOUR TEACHER

Listen to the new report. Switch speakers. Keep or change your call; point to the new evidence.

“We first said ___. Now we ___ because ___.”

Editor’s check: Say what two sightings cannot establish about the velocity between them.
