Where would a mixed-use building help?

Task 2.1 / Neighborhood evidence

Name _____ Team _____ Date _____

Design for someone who lives in the building and needs to reach a nearby business or service. Start with a place you know. A public intersection or school area works.

01 Read the neighborhood

In the app, open Peter Park's "Redesigning America," printed pp. 83-87. Find one planning choice that changes a resident's trip. Record the page and explain the effect in your words.

02 Walk through a real trip

Name a public starting point, a destination and a way to get there. What helps someone reach it? Where would a sidewalk, crossing, entrance or closer service make a difference?

03 Consider two responses to sprawl

Sprawl spreads homes and destinations farther apart. Describe one local effect. Compare two ways a change to the neighborhood could help.

Possible change	Who benefits and how?

Proposed site and the resident or service user you will design for

How much space does the design need?

Task 2.1 / Field measurements

Name _____ Team _____ Date _____

04 Calibrate a walking step

Mark a start point. Walk 10 ordinary steps in a straight, safe space. Your partner measures the distance in feet. Repeat three times. You can also direct a partner or use a tape for the room survey.

Walk	Distance for 10 steps (ft)	Distance ÷ 10 (ft/step)
1		
2		
3		
Average		

05 Survey a room

Use the same walker and count steps along two sides. Multiply each count by average ft/step. For a direct tape survey, enter the measured feet and mark the counts N/A.

Room and side	Steps	Estimated ft	Tape check (ft)	Difference (ft)
Length				
Width				

Area = length × width. Show both dimensions with units and calculate area in ft².

How many people usually use this room? Divide ft² by people. Name a second space that would need more or less room per person and explain why.

Draw a route a resident can actually use

Task 2.1 / Design brief and first plan

Name _____ Team _____ Date _____

06 Set the brief

Include housing access and one business or community service. Describe observable signs of success and real limits on space, materials, energy use or access.

Success criterion	Constraint or limit

07 Draw the ground floor

Label the street, both uses, entrances and one dimension with units. Trace one trip from a dwelling entrance to the service. Mark any point where that route leaves the building.

What feature of your plan responds to the need on sheet 1?

Test the trip and revise the design

Task 2.1 / Partner check and individual exit

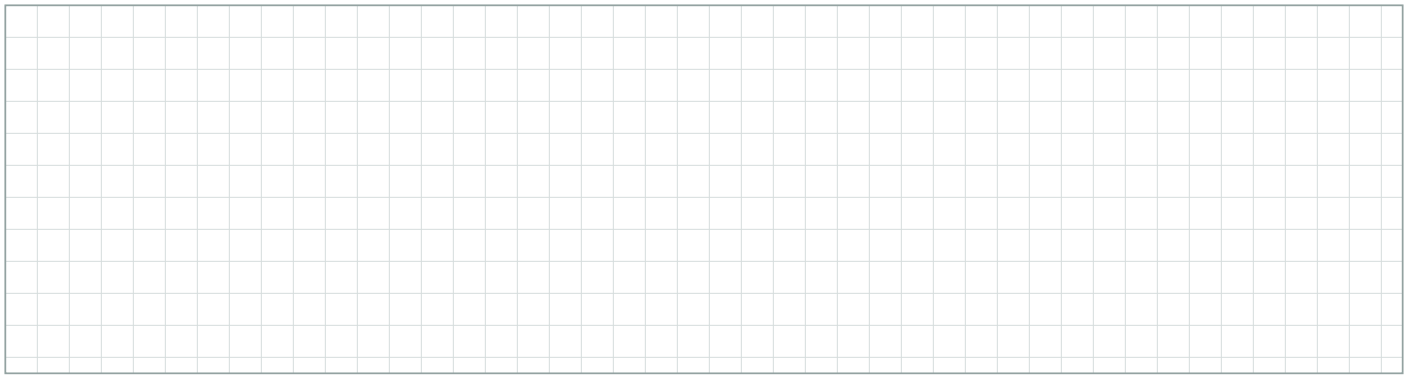
Name _____ Team _____ Date _____

08 Give the plan to another reader

Ask a partner to trace the trip without hints. Record their starting point, their destination and the first place they paused or found a barrier.

09 Revise one part of the route

Draw the revised entrance or route below. Label what moved. Add an arrow or dimension showing why the revision makes the trip work better.



Which criterion or constraint guided your revision?

10 Individual explanation

What local need does your building meet? Give a room dimension or area with units. Use one idea from Peter Park and one detail from your sketch to justify a design decision.

Turn in these sheets as directed. In the online lesson, enter your individual explanation under Explain. Complete the assigned reading check in the interactive reader.
