An orbit is continuous falling

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain a circular orbit with gravity and sideways motion.

SUCCESS CRITERIA - I can...

1. Describe orbit as free fall rather than absent gravity.
2. Distinguish tangent velocity from inward force.
3. Connect circular speed to orbital radius.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “orbit” and “gravity” to explain your answer. Sentence starters are optional.

orbit: a path around another body under gravity

gravity: an attractive interaction between masses

radius: distance from the center to the edge of a circle or sphere

01 Warm-up: bring back an earlier idea

A projectile launches horizontally at **5 m/s** from height **20 m**.
1. Use g=**10** and no drag.
2. **Find flight time**, range and final vertical velocity.

Word help: vertical = up and down, usually the y direction

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

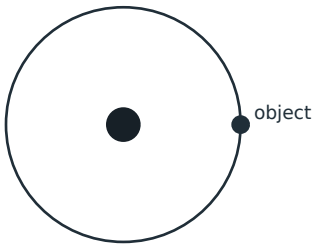

02 Worked example: explain the prediction

Reference: $GM/r^2 = v^2/r$; $v = \sqrt{(GM/r)}$.
Circular orbit outside a spherical body of mass M; r is orbital radius. Neglect atmosphere and other bodies.

Worked reasoning: A small circular path used for practice has radius **4 m** and speed **2 m/s**. Its period is circumference/speed=**2**π×**4**/**2**=**4**π s. Gravity continuously changes the velocity direction.

Your turn: Draw a quarter-orbit with tangent velocity arrows and inward gravitational arrows.

Sentence starter: In my work, I used ... to show ... . I labeled it ... .

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

An orbit is continuous falling

antocciphysics

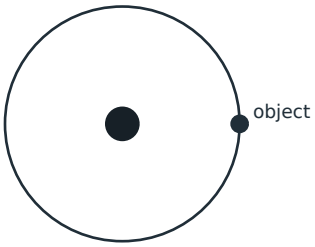

Continue down each column.

Sentence starters are optional. You may plan in any language.

03 Read and explain the diagram or equation

1. **Draw the path of an** orbiting object and its velocity/force arrows.
2. **Explain how it can fall** without immediately hitting the surface.

Sentence starter: For this answer, I treated … as true. I found … . This supports … because … .

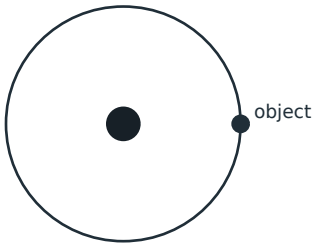

The center is the attracting body; the small dot on the circle is the orbiting object.

Marzano check - circle: ① ② ③

04 Apply the physics

For a simulated planet GM=**400 m³/s²** and circular radius **16 m**, find orbital speed, period and acceleration. **Label the radius** and **show velocity** and inward acceleration on the circle.

Sentence starter: My design includes … . It does what is needed by … .

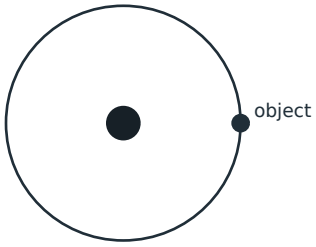

Marzano check - circle: ① ② ③

05 Explain your reasoning

Why does a rocket not need to keep firing forward to remain in an ideal circular orbit?

Word help: ideal = using stated simplifying conditions

Sentence starter: For this answer, I treated … as true. I found … . This supports … because … .

Marzano check - circle: ① ② ③

An orbit is continuous falling

antocciphysics

Continue down each column.

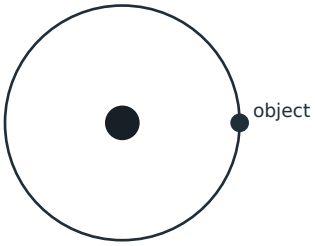

Sentence starters are optional. You may plan in any language.

06 Review: connect an earlier idea

A **4 kg** object moves at **6 m/s** in an ideal circle under a force perpendicular to velocity. **Explain which parts of velocity** change and whether the force does work. **Label velocity** and inward acceleration on the circular-path diagram.

Word help: acceleration = rate of change of velocity

Sentence starter: For this answer, I treated … as true. I found … . This supports … because … .

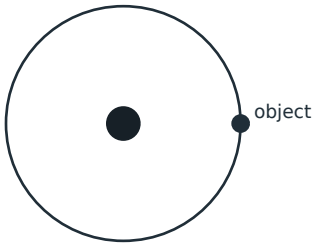

Marzano check - circle: 1 2 3

07 Exit check

If circular orbital radius increases by factor **4** around same body, compare speed and period. **Label the radius** and **show velocity** and inward acceleration on the circle.

Sentence starter: Both … . They differ in … because … .

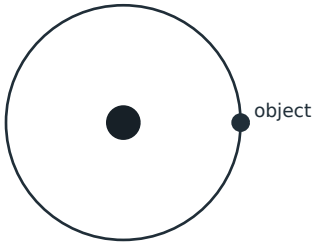

Marzano check - circle: 1 2 3

08 STRETCH: test the prediction

Around one source, a circular orbit radius increases ninefold.
1. **Compare speed**, period and gravitational acceleration without inserting a source mass.
2. **Label the radius** and **show velocity** and inward acceleration on the circle.

Sentence starter: Both … . They differ in … because … .

Marzano check - circle: 1 2 3
