Sliding, swinging and rolling

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose the energy terms that match the type of motion.

SUCCESS CRITERIA - I can...

1. Distinguish translational and rotational kinetic energy.
2. Use equal height changes to compare ideal energy changes.
3. State when treating an object as a point mass leaves out important physics.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “translation” and “rotation” to explain your answer. Sentence starters are optional.

translation: motion of an object’s center from place to place

rotation: turning about an axis

pendulum: an object that swings about a fixed support

01 Warm-up: bring back an earlier idea

Lift a **4 kg** object by **6 m**.
1. Use g=**10 N/kg**.
2. **Find the change** in gravitational potential energy.

Word help: potential energy = energy associated with the configuration of interacting objects

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: ① ② ③

02 Worked example: explain the prediction

Reference: $K_{translation} = \frac{1}{2}mv^2$; $K_{total} = K_{translation} + K_{rotation}$. A rolling object also rotates. Track all energy forms; an ideal pendulum exchanges gravitational and kinetic energy.

Worked reasoning: An object loses **20 J** of gravitational potential energy. If **8 J** becomes rotational kinetic energy and losses are negligible, only **12 J** becomes translational kinetic energy.

Your turn: Draw three energy bars and **explain why assigning all 20 J** to forward speed would be wrong.

Sentence starter: The step I would change is … . I would change it because I found … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

03 Read and explain the diagram or equation

A slider and a rolling wheel start at the same height from rest. Why can the wheel reach the bottom with a lower center speed?

Sentence starter: I think … . I can point to …, which shows …, so … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

04 Apply the physics

A wheel loses **20 J** of gravitational potential energy while rolling down a ramp. Of this, **5 J** becomes rotational kinetic energy. Assume no losses. **Complete the account** and **find how much energy becomes** forward motion.

Sentence starter: I found … [unit]. This value means … in this situation.

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

Sliding, swinging and rolling

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Explain your reasoning

A pendulum’s tension is perpendicular to its instantaneous motion in the ideal case where its length stays fixed. What work does tension do, and which interaction changes K?

Word help: ideal = using stated simplifying conditions

Sentence starter: I notice … . This supports … because … .

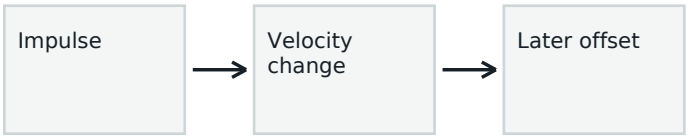

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

A simplified deflection adds **0.4 m/s** sideways for a lead time of **60 s**. **Find the predicted shift** and **name something you** are treating as true.
Label the quantities in the diagram and say what it treats as true.

Word help: deflection = a change in the direction or path of motion

Sentence starter: I think … . I can point to …, which shows …, so … .

Marzano check - circle: 1 2 3

07 Exit check

Why should a rolling-wheel energy diagram include more than translational kinetic energy? **Use the energy** diagram to **show the quantities you compare**; **label units** and any unknowns.

Sentence starter: Both … . They differ in … because … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: 1 2 3

08 STRETCH: test the prediction

1. **Compare a sliding object** and a rolling object from the same height with no losses.
2. **Explain why equal total energy** need not give equal center-of-mass speeds.
3. **Use the energy** diagram to **show the quantities you compare**; **label units** and any unknowns.

Sentence starter: Both … . They differ in … because … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: 1 2 3
