Escape speed

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain escape using a simplified gravitational-energy calculation.

SUCCESS CRITERIA - I can...

1. State the zero-at-infinity energy convention.
2. Distinguish escape speed from circular-orbit speed.
3. Name neglected effects in the ideal calculation.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

Total kinetic energy changes from **15 J** to **12 J** in an isolated collision. Is it elastic? Where could the difference go?

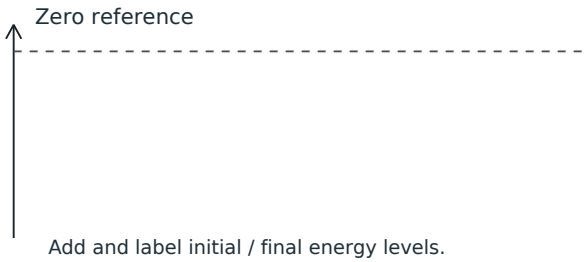

Marzano check - circle: ① ② ③

02 Worked example: explain the prediction

Reference: $v_{escape} = \sqrt{(2\ GM/r)}$; $v_{circular} = \sqrt{(GM/r)}$. Ideal spherical body; ignore atmosphere/rotation. Minimum escape reaches infinity at zero speed with no further thrust.

Worked reasoning: For a simulated planet with GM=**50 m³/s²** and radius **4 m**, escape speed is $\sqrt{(2\ GM/R)}$=**5 m/s**. At that limiting speed the ideal final speed at infinity is zero.

Your turn: Draw initial kinetic and gravitational-potential-energy bars whose total is zero.

Add and label initial / final energy levels.

Label K/m, U/m and total E/m in J/kg.

Marzano check - circle: ① ② ③

03 Read and explain the diagram or equation

Does escaping mean that gravity turns off at the launch point? **Explain what the speed allows** using energy calculations.

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

04 Apply the physics

A projectile needs **50 J** to reach infinity. It starts with **60 J** of kinetic energy. Ignore energy losses. **How much energy** is left at infinity? **Use the energy** diagram to **show the quantities you compare**. **Label units** and unknowns.

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

Escape speed

antocciphysics

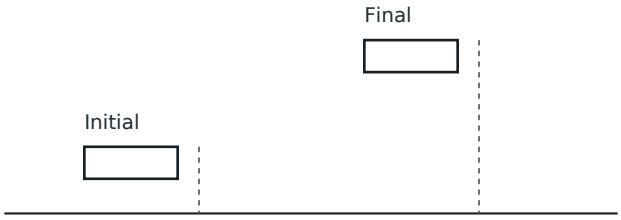

05 Explain your reasoning

Why is an ideal escape-speed calculation not a complete rocket-launch plan?

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

Lift a **6 kg** object by **8 m**. Use g=**10 N/kg**. **Find the change** in gravitational potential energy.
Label the distances or energy levels used in your reasoning.

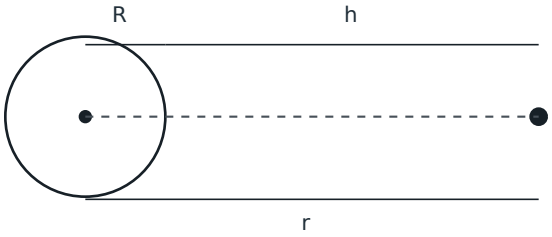

Choose and label a zero-height level.

Marzano check - circle: 1 2 3

07 Exit check

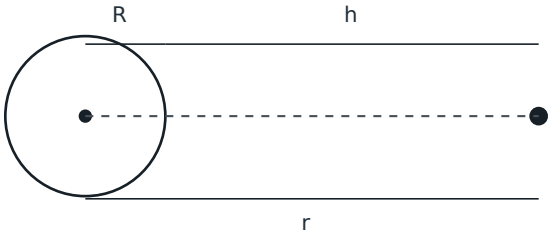

An object has less energy than it needs to escape. It receives no further thrust. Does this ideal calculation predict that it will escape? **Use the energy** diagram to **show the quantities you compare**. **Label units** and unknowns.

Marzano check - circle: 1 2 3

08 STRETCH: test the prediction

The same simulated planet's circular orbital speed at its surface is supplied as **3.54 m/s**.
1. **Compare it** with escape speed **5 m/s** and **explain their different purposes**.
2. **Use the energy** diagram to **show the quantities you compare**; **label units** and any unknowns.

Marzano check - circle: 1 2 3
