Lenses and image formation

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use ray directions to explain converging and diverging lens behavior.

SUCCESS CRITERIA - I can...

1. Distinguish converging and diverging lenses.
2. Trace principal rays with a clear optical axis.
3. State whether an image is real or virtual in the given case.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

A siren emits **500 Hz** steadily while approaching a stationary listener. **Compare observed** and emitted frequency and explain.

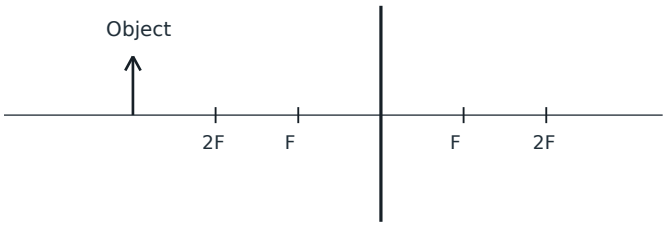

Marzano check - circle: ① ② ③

02 Worked example: explain the prediction

Reference: $\mathbf{1}/f = \mathbf{1}/d_o + \mathbf{1}/d_i$.
Thin lens: f is focal length; o = object, i = image. Use the stated sign convention and a ray diagram.

Worked reasoning: A converging lens can form a real image of an object beyond its focal point. A ray parallel to the axis passes through the far focus; a central ray is nearly straight when the lens is treated as very thin.

Your turn: Draw these two rays and **mark their intersection** for an object beyond **2** f.

Converging thin lens; add principal rays.

Marzano check - circle: ① ② ③

03 Read and explain the diagram or equation

Complete ray sketches for parallel rays through a converging lens and a diverging lens. **Label the optical axis 0**.

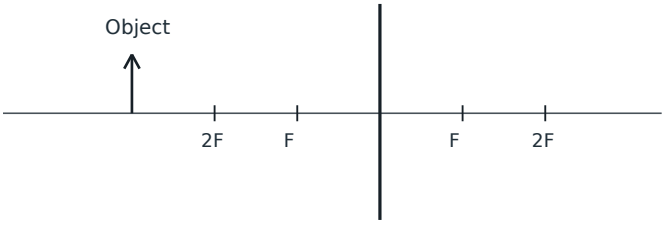

Left: converging lens. Right: diverging lens. Horizontal lines mark the optical axes.

Marzano check - circle: ① ② ③

04 Apply the physics

A small lamp sits 3f from a converging lens, as marked.
1. **Draw a ray parallel** to the axis and a ray through the lens center.
2. Use their intersection to classify the image as upright/inverted and real/virtual.

Converging thin lens; add principal rays.

Marzano check - circle: ① ② ③

Lenses and image formation

antocciphysics

Continue down each column.

05 Explain your reasoning

A magnifying glass produces an upright virtual image when object is inside f. **Explain why** “converging lens always makes a real image” is wrong.

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

A wave has period **4 s**. **Find the cycles completed** in **24 s** and its frequency.
Label a wave sketch to **support the calculation or comparison**.

Time or position: choose and label

Marzano check - circle: 1 2 3

07 Exit check

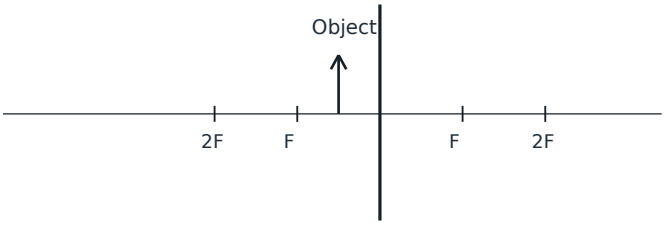

Which lens spreads parallel rays: converging or diverging?

Marzano check - circle: 1 2 3

08 STRETCH: test the prediction

Move the object between the converging lens and its focal point. **Predict whether** outgoing rays meet physically beyond the lens and **describe the image qualitatively**.

Converging thin lens; add principal rays.

Marzano check - circle: 1 2 3
