Race, explain and transfer

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Compare your predicted result with measured performance. Use the results to explain your design choices.

SUCCESS CRITERIA - I can...

1. Report measured distance, time and average speed.
2. Compare actual speed with a stated prediction.
3. Use measurements or observations to explain three physical design choices.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

At unchanged wheel rpm, circumference becomes **6** times as large. **Compare ideal travel speed** and **state one real-world limitation**.

Marzano check - circle: ① ② ③

02 Worked example: explain the prediction

Reference: average speed = distance/time
relative deviation = |measured - predicted|/|predicted| × **100%**.
Prediction must be nonzero. **Record actual track**, starting method, and setup; this compares with a prediction, not symmetric percent difference.

Worked reasoning: A car covers **3 m** in **2 s**: average speed **1.5 m/s**. A complete explanation also uses its circuit, gearing, friction and measurements from repeated runs; one race time does not isolate a cause.

Your turn: Draw an energy-flow diagram from battery to motion and other transfers; annotate it with one actual result, clearly labeled as measured.

Draw and label all energy transfers across the boundary.

Chosen system

Stored energy change: _____ J

Marzano check - circle: ① ② ③

03 Read and explain the diagram or equation

1. **Draw or annotate your final** car.
2. **Label three choices involving wheels**, gears, alignment, wiring or mass, then connect each to a physics idea.

Marzano check - circle: ① ② ③

04 Apply the physics

A supplied car covers **5 m** in **10 s**; its predicted speed was **0.60 m/s**. **Complete the comparison table**.
1. **Find measured speed** and use the **0.10 m/s** difference to **calculate percent deviation relative** to the prediction.
2. State whether it was faster or slower.

Distance (m)	Time (s)	Measured v	Predicted v
___	___	___	___

Marzano check - circle: ① ② ③

Race, explain and transfer

antocciphysics

05 Explain your reasoning

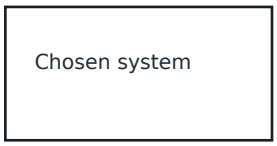

Use your actual race record to defend one successful design choice and **name one revision** for a future build. Cite data or a specific observation for each.

Marzano check - circle: ① ② ③

06 Review: connect an earlier idea

A device receives **60 J** mechanical energy at its shaft and produces electrical energy at its terminals. **Name it** and **name one possible loss**.
Label input, useful output and other energy transfers.

Draw and label all energy transfers across the boundary.

Stored energy change: _____ J

Marzano check - circle: ① ② ③

07 Exit check

Choose one problem on this sheet. Circle your current **1**, **2** or **3** self-check and **name the next step** that would improve your explanation.

Problem chosen	What I can explain	Next time
___	___	___

Marzano check - circle: ① ② ③

08 STRETCH: test the prediction

1. Propose one redesign and **predict two possible effects**, including a tradeoff.
2. **State the measurement** that would support or challenge your prediction.

Proposed change	Benefit / tradeoff	Test
___	___	___
___	___	___

Marzano check - circle: ① ② ③
