Vector addition

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Add displacement vectors and use a model to explain where an object ends up.

SUCCESS CRITERIA - I can...

1. Draw and label arrows tip to tail; keep their length and direction.
2. Draw the resultant from the original start to the final endpoint.
3. State net east-west and north-south motion with units and direction.

Core: teacher selects from 1-10. **Stretch:** 11-12 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

A cart moves from 0 m to 8 m east in 4 s at a steady pace. Find its speed. Draw a velocity arrow showing its direction. Explain what the arrow tells you that speed alone does not.

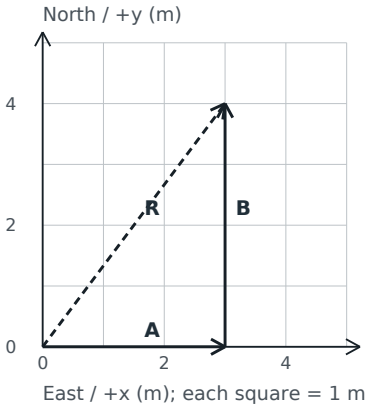

Marzano check - circle: ① ② ③

02 Read and explain a worked model

Reference: $R_x = A_x + B_x$; $R_y = A_y + B_y$.
Use east = +x and north = +y. Add signed components; draw R from the original start to the final endpoint.

Worked reasoning: Add east-west and north-south motion separately: R_x = 3 m and R_y = 4 m. The route length is 3 + 4 = 7 m. The supplied straight-line length is 5 m.

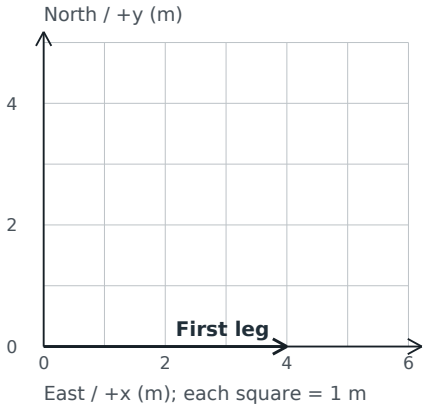

Your turn: A walker goes 3 m east, then 4 m north. On the model, circle the original start and final endpoint. Explain why the distance is 7 m while the displacement magnitude is 5 m.

Marzano check - circle: ① ② ③

03 Finish the model

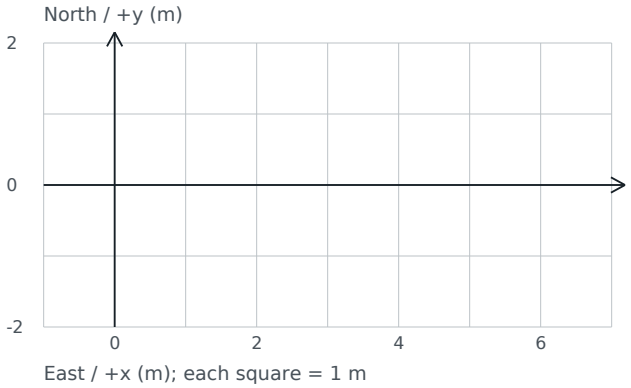

Walk 4 m east, then 3 m north. The first arrow is drawn. Add the second arrow from its tip and a dashed resultant from the original start.

Marzano check - circle: ① ② ③

04 A trip that doubles back

Walk 6 m east, then 4 m west. Draw and label the route and resultant. Give distance and displacement. Explain which length follows the path.

Marzano check - circle: ① ② ③

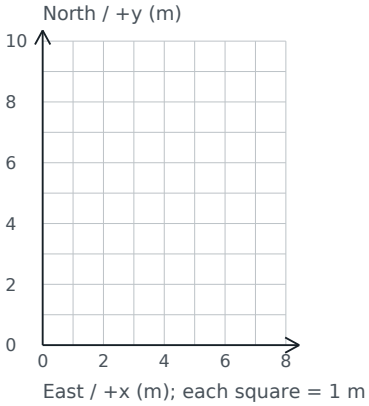

Vector addition

antocciphysics

Continue down each column.

05 Use a new scale

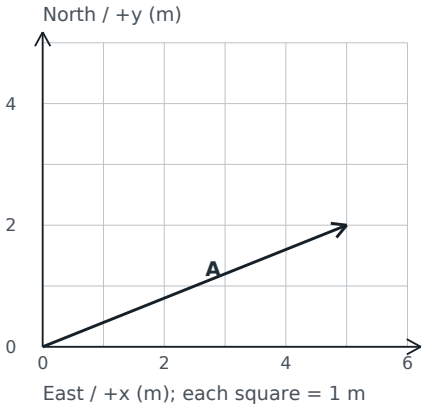

Walk 6 m east, then 8 m north. Draw both arrows and the resultant. Give distance and displacement. The straight-line length is supplied: 10 m.

Marzano check - circle: ① ② ③

06 Add two diagonal arrows

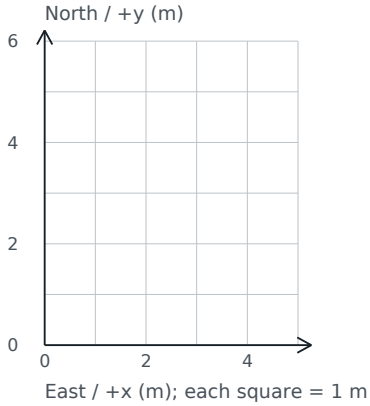

A: 5 m east and 2 m north. B: 3 m west and 1 m north. A is drawn. Add B and R. State each net component and the general compass direction.

Marzano check - circle: ① ② ③

07 Predict, draw, check

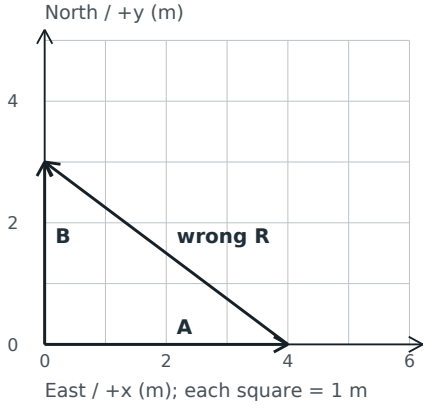

Walk 3 m east, 4 m north, then 3 m west. Predict what cancels. Draw the route and R. Give distance and displacement. Check your prediction against the model.

Marzano check - circle: ① ② ③

08 Find and repair the mistake

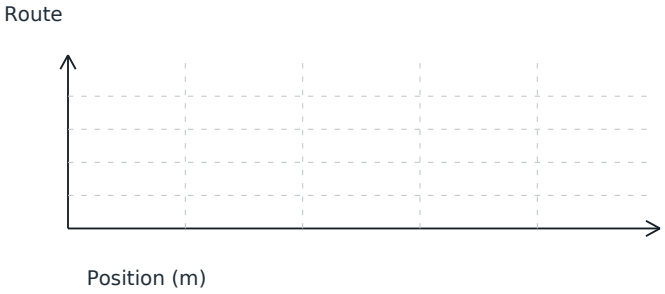

Sam draws the two displacement arrows from the same start, then connects their tips and calls that arrow the resultant. The model shows his mistake. Draw the correct tip-to-tail route beside it. Explain where the correct resultant must begin and end.

Marzano check - circle: ① ② ③

09 One trip, three questions

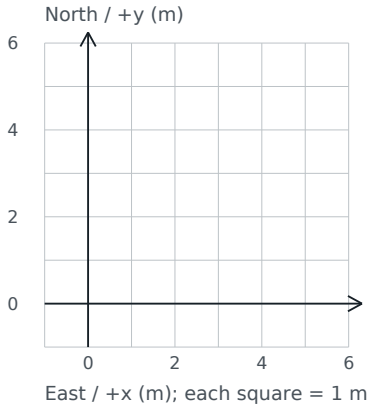

A student walks 6 m east in 6 s, then 8 m north in 8 s. The direct start-to-finish length is 10 m. For each answer, decide whether to use path length or the start-to-finish arrow, then solve:
(a) Distance walked? (b) Displacement?
(c) Average speed for the whole trip?
Label the model with the given positions and any prediction.

Marzano check - circle: ① ② ③

10 Exit check - work independently

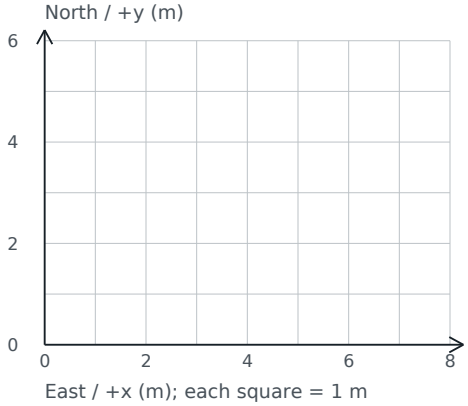

A robot makes two moves. First: 4 m east and 1 m north. Second: 1 m west and 3 m north. Draw both moves tip-to-tail and add the resultant. State its two components and general compass direction. Explain one way to check the result.

Marzano check - circle: ① ② ③

11 STRETCH: Design two routes

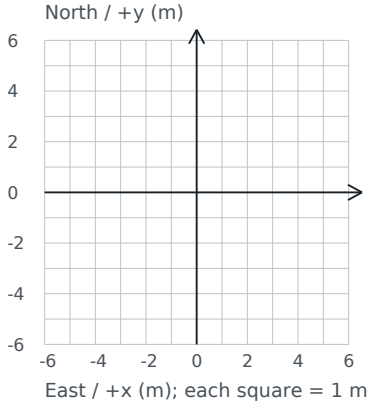

Finish 4 m east and 3 m north of your start. Design one route of length 7 m and another of length 11 m. Use only north, south, east or west legs. Label all lengths and draw each resultant.

Marzano check - circle: ① ② ③

12 STRETCH: Explore the limits

Point two 5 m displacement arrows in any directions. Draw the smallest and largest possible resultants, then one between those extremes. Estimate the intermediate resultant and explain why your limits make sense.

Marzano check - circle: ① ② ③
