Static and kinetic friction

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Distinguish adjustable static friction from sliding friction.

SUCCESS CRITERIA - I can...

1. Compare a push with the static-friction limit.
2. Find actual friction for rest or sliding.
3. Explain friction direction using relative slipping.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “friction” and “static” to compare your model or result. Sentence starters are optional.

friction: a contact force opposing relative sliding or its tendency

static: not sliding relative to the contacting surface

kinetic: associated with motion; kinetic friction acts during sliding

01 Warm-up: bring back an earlier idea

A spacecraft of mass 3 kg pushes an asteroid of mass 300 kg with 15 N.
Compare interaction forces and the accelerations due to that interaction.

Word help: interaction = two objects affecting one another

Sentence starter: Both ... . They differ in ... because ... .

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: $0 \le f_s \le \mu_s N$; $f_k = \mu_k N$.
s = static; k = kinetic; N = normal force. Static friction adjusts up to its maximum. Kinetic friction applies during sliding.

Worked reasoning: A box remains still while pushed with 3 N. Static friction is 3 N opposite the push, provided its maximum is at least 3 N. Static friction need not equal its maximum.

Your turn: Draw the horizontal forces. Then redraw for a 5 N push that is still below the maximum.

Sentence starter: The ... in my model represents ... . Its label shows ... .

Box remains at rest. Redraw for a 5 N push.

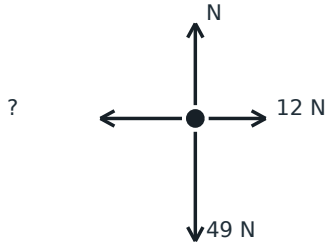

Marzano check - circle: ① ② ③

03 Actual versus maximum

A 5 kg box is initially at rest on a level floor. Its friction coefficients are $\mu_s = 0.40$ and $\mu_k = 0.30$. A horizontal push is 12 N.
Use g = 9.8 N/kg.
Find the normal force, maximum static friction, actual friction and acceleration.
Label the diagram.

Word help: at rest = not moving in the chosen reference frame

Sentence starter: I found ... [unit]. This value means ... in this situation.

The dot represents the object. Initially at rest

Marzano check - circle: ① ② ③

04 Sliding case

Increase the push on that box to 25 N.
Find friction and acceleration after it slides.

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

Static and kinetic friction

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Estimate from data

A class tests a block with a 20 N normal force.
Use the repeated measurements to find mean peak force, mean sliding force, and estimates of μ_s and μ_k. Which estimate describes the threshold for slipping?

Word help: estimate = find an approximate value

Sentence starter: I found … [unit]. This value means … in this situation.

Trial	Peak force (N)	Sliding force (N)
1	8	6
2	9	5
3	7	7

Marzano check - circle: ① ② ③

06 Review: connect an earlier idea

x_i=-4±0.5 m, v=6±0.1 m/s and exact t=8 s.
Give central final position, its conservative interval and full width.
Name an assumption.
Label the model with the given positions and any prediction.

Word help: final = at the end of the interval; subscript f

Sentence starter: I predict … . My model supports this because … .

Position (m)

Time (s)

Marzano check - circle: ① ② ③

07 Exit check

A 10 kg box has μ_s = 0.50 and μ_k = 0.40.
Use g = 9.8 N/kg.
Compare a 30 N push with a 60 N push, starting from rest each time.
Find actual friction and acceleration in both cases.

Sentence starter: Both … . They differ in … because … .

Push (N)	Still or sliding?	Friction (N)	a (m/s²)
30	____	____	____
60	____	____	____

Marzano check - circle: ① ② ③

08 STRETCH: test the model

A 5 kg box has μ_s=0.4 and μ_k=0.3 on a level floor; use g=10 N/kg. A horizontal 22 N pull begins from rest.
Find maximum static friction, acceleration after motion starts, and the pull needed for steady sliding.

Sentence starter: I found … [unit]. This value means … in this situation.

Add and label force arrows.

Draw the sliding case, with actual friction.

Marzano check - circle: ① ② ③
