Transfer: gravity and motion

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Apply gravity, projectile and orbital reasoning to a new set of cases.

SUCCESS CRITERIA - I can...

1. State a model and assumptions before calculating.
2. Connect diagrams to forces and motion.
3. Check units and explain the limits of conclusions.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

A satellite follows a circular orbit at a constant 5 km/s. Draw velocity and acceleration at the top and side of the orbit. Explain the different directions.

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: $F_g = mg$; $a_c = v^2/r$; $h = \frac{1}{2}gt^2$; range = $v_x t$. Match each equation to its case: near-surface weight, circular motion, or horizontal launch. Use g = 10 m/s².

Worked reasoning: A toy horizontal projectile falls for 2 s while moving at 4 m/s. Range is 8 m. The vertical motion sets time; the horizontal motion sets range once time is known.

Your turn: Draw two coordinated timelines, one for each direction, with a shared 2 s endpoint.

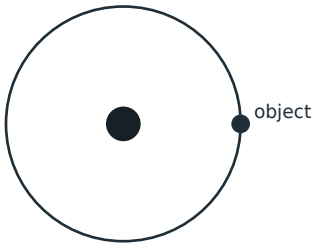

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

03 Read and interpret the model

A satellite moves in a circular orbit. Draw velocity and gravity arrows. Explain why floating does not mean zero gravity.

The center is the attracting body; the small dot on the circle is the orbiting object.

Marzano check - circle: ① ② ③

04 Apply the physics

A ball launches horizontally at 6 m/s. Supplied fall time is 2 s. Find range. If height stays same and launch speed halves, find new range. Label the model with the known quantities before calculating. Ignore air resistance; use g = 10 m/s² when needed.

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

Transfer: gravity and motion

antocciphysics

Continue down each column.

05 Explain your reasoning

A Sun-orbit returns every 2 years. Why can period alone not prove an Earth encounter? Name one piece of evidence you would request.

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

Two fixed masses attract with 144 N at separation r. Find the force at separation 6 r and explain the factor.
Label the masses, field or force relevant to the question.

Label separation if needed.

Source Object

Marzano check - circle: 1 2 3

07 Exit check

Surface field is 8 N/kg. At center distance 2 R, find field and force on a 3 kg object. Label the model with the known quantities before calculating. Ignore air resistance; use g = 10 m/s² when needed.

Separate horizontal and vertical motion

Label x and y; state positive directions.

Velocity:

Acceleration / force:

Marzano check - circle: 1 2 3

08 STRETCH: test the model

Design two launches from the same height with ranges in a 1: 3 ratio. State what you change and what remains fixed. Label the model with the known quantities before calculating. Ignore air resistance; use g = 10 m/s² when needed.

Add velocity / acceleration arrows.

Marzano check - circle: 1 2 3
