Sliding, swinging and rolling

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose the energy terms that match the type of motion.

SUCCESS CRITERIA - I can...

1. Distinguish translational and rotational kinetic energy.
2. Use equal height changes to compare ideal energy changes.
3. State when a simple point-mass model is insufficient.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “translation” and “rotation” to explain your model or result. Sentence starters are optional.

translation: motion of an object’s center from place to place

rotation: turning about an axis

pendulum: an object that swings about a fixed support

01 Warm-up: bring back an earlier idea

Lift a 4 kg object by 6 m.
Use g=10 N/kg.
Find the change in gravitational potential energy.

Word help: potential energy = energy associated with the configuration of interacting objects

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: $K_{translation} = \frac{1}{2}mv^2$; $K_{total} = K_{translation} + K_{rotation}$. A rolling object also rotates. Track all energy forms; an ideal pendulum exchanges gravitational and kinetic energy.

Worked reasoning: An object loses 20 J of gravitational potential energy. If 8 J becomes rotational kinetic energy and losses are negligible, only 12 J becomes translational kinetic energy.

Your turn: Draw three energy bars and explain why assigning all 20 J to forward speed would be wrong.

Sentence starter: The step I would change is ... . The evidence is ... .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Sliding, swinging and rolling

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

03 Read and interpret the model

A slider and a rolling wheel start at the same height from rest. Why can the wheel reach the bottom with a lower center speed?

Sentence starter: My claim is … . The diagram/data show …, so … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

04 Apply the physics

A model wheel loses 20 J of gravitational potential energy while rolling down a ramp. Of this, 5 J becomes rotational kinetic energy. Assume no losses. Complete the account and find how much energy becomes forward motion.

Sentence starter: I found … [unit]. This value means … in this situation.

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: ① ② ③

05 Explain your reasoning

A pendulum’s tension is perpendicular to its instantaneous motion in the ideal fixed-length model. What work does tension do, and which interaction changes K?

Word help: ideal = using stated simplifying conditions

Sentence starter: I notice … . This supports … because … .

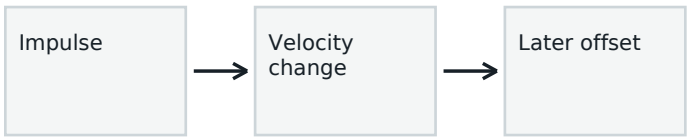

Marzano check - circle: ① ② ③

06 Review: connect an earlier idea

A simplified deflection adds 0.4 m/s sideways for a lead time of 60 s.
Find the modeled shift and name an assumption.
Label the quantities in the model and state its assumptions.

Word help: deflection = a change in the direction or path of motion

Sentence starter: My claim is … . The diagram/data show …, so … .

Marzano check - circle: ① ② ③

Sliding, swinging and rolling

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

07 Exit check

Why should a rolling-wheel energy diagram include more than translational kinetic energy?
Use the energy model to show the quantities you compare; label units and any unknowns.

Sentence starter: Both … . They differ in … because … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: 1 2 3

08 STRETCH: test the model

Compare a sliding object and a rolling object from the same height with no losses.
Explain why equal total energy need not give equal center-of-mass speeds.
Use the energy model to show the quantities you compare; label units and any unknowns.

Sentence starter: Both … . They differ in … because … .

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: 1 2 3
