Conduction, convection, radiation

antocciphysics

UNIT 5 / DAY 3 / HONORS

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Identify mechanisms of heat transfer and support each classification.

SUCCESS CRITERIA - I can...

1. Describe contact transfer, bulk fluid motion and electromagnetic transfer.
2. Use evidence from the situation.
3. Recognize that more than one mechanism can act.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

A simulated source has GM=150 m^3/s^2. At r=3 m, find escape speed and state two assumptions.

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: $E_i + E_{in} = E_f + E_{out}$.
Account for energy across the system boundary. Conduction: matter interactions; convection: fluid motion; radiation: electromagnetic waves.

Worked reasoning: A metal rod transfers energy from its hot end toward its cool end by conduction. A circulating fluid can carry energy by convection; radiation can cross a vacuum.

Your turn: Draw one distinct, labeled model for each mechanism. Show the direction of energy transfer.

Conduction	Convection	Radiation
Sketch:	Sketch:	Sketch:
_____	_____	_____

Marzano check - circle: ① ② ③

03 Read and interpret the model

Classify: a metal spoon warming in soup; circulating water in a pot; sunlight warming your hand. Give a reason for each.

Situation	Mechanism	Evidence
Spoon in soup	____	____
Circulating water	____	____
Sunlight on skin	____	____

Marzano check - circle: ① ② ③

04 Apply the physics

A wall transfers energy from a warm room to outdoors at a steady 40 W for 5 minutes. Label the direction and calculate the energy transferred. Predict how doubling the wall thickness affects conduction if material, area and temperature difference stay fixed.

Sample A

Sample B

Label temperatures and draw energy-transfer arrows.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Conduction, convection, radiation

antocciphysics

Continue down each column.

05 Explain your reasoning

An asteroid travels through nearly empty space. Which of these mechanisms can transfer thermal energy to it from sunlight? Why not ordinary air convection?

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

Supplied data: m=0.4 kg, drop h=0.6 m, final speed 2 m/s from rest, g=9.8. Find mgh, translational K and the fraction appearing as translation.
Show the energy changes and transfers; label units.

Initial **Transfers** **Final**

Draw bars or transfer arrows; label forms and joules.

Marzano check - circle: 1 2 3

07 Exit check

A hot object in a vacuum still cools. Identify the transfer mechanism and explain whether absolute zero surroundings are required.

Sample A

Sample B

Label temperatures and draw energy-transfer arrows.

Marzano check - circle: 1 2 3

08 STRETCH: test the model

A vacuum flask still loses heat. Identify two paths that remain and propose measurements that distinguish them.

Sample A

Sample B

Label temperatures and draw energy-transfer arrows.

Marzano check - circle: 1 2 3
