Sound: pitch and amplitude

antocciphysics

UNIT 6 / DAY 8 / CPA + SEI

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use a longitudinal-wave model to distinguish pitch and sound level.

SUCCESS CRITERIA - I can...

1. Describe compressions and rarefactions.
2. Connect pitch primarily with frequency.
3. Separate particle motion from sound propagation.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “pitch” and “amplitude” to compare your model or result. Sentence starters are optional.

pitch: the perceived highness or lowness of a sound

amplitude: maximum displacement from equilibrium for the wave

longitudinal: a disturbance parallel to the wave’s travel direction

01 Warm-up: bring back an earlier idea

A wave enters a medium where its speed is 3 times as large, at a small angle below critical conditions. Does the transmitted ray bend toward or away from the normal?

Word help: medium = the material through which a mechanical wave travels

Sentence starter: I notice … . This supports … because … .

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: $T = 1/f$; $v = f\lambda$.
Higher f generally means higher pitch. Amplitude affects intensity under matched conditions, not frequency.

Worked reasoning: A tuning fork makes 440 cycles each second, so its frequency is 440 Hz. A louder version can have the same frequency but greater amplitude.

Your turn: Draw two displacement-time traces with equal periods and different amplitudes.

Sentence starter: Both … . They differ in … because … .

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Sound: pitch and amplitude

antocciphysics

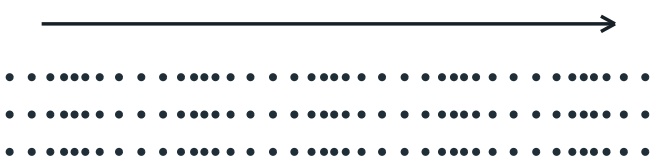

Continue down each column.

Sentence starters are optional. You may plan in any language.

03 Read and interpret the model

Mark compressions and rarefactions in the particle picture. Do air particles travel from speaker to listener with the disturbance?

Sentence starter: I notice … . This supports … because … .

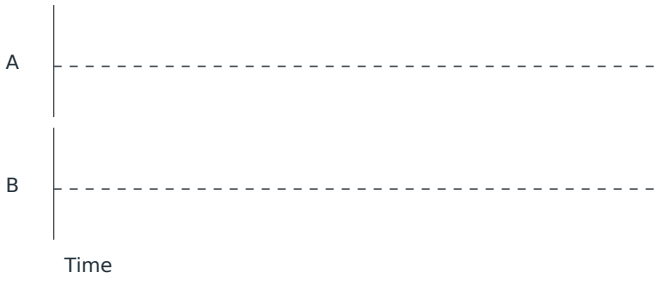

Label dense and sparse regions.

Marzano check - circle: 1 2 3

04 Apply the physics

A tone generator plays A at 200 Hz and B at 400 Hz. Which has higher pitch?
Find how many cycles each produces in 2 s.
Sketch time traces with equal amplitudes to show the frequency difference.

Sentence starter: Both … . They differ in … because … .

Marzano check - circle: 1 2 3

05 Explain your reasoning

Turning up a speaker’s volume does not normally double a song’s pitch.
Explain which wave property mainly changes.

Sentence starter: My claim is … . The diagram/data show …, so … .

Marzano check - circle: 1 2 3

Sound: pitch and amplitude

antocciphysics

Sentence starters are optional. You may plan in any language.

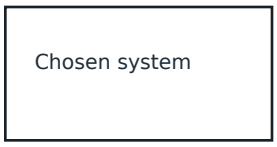

06 Review: connect an earlier idea

A refrigerator uses 24 J electrical work while moving heat from its colder interior to a warmer room.
Explain why this is not spontaneous cold-to-hot heat flow.
Label energy entering, leaving and stored.

Word help: spontaneous = able to occur without the specified external work input

Sentence starter: My claim is … . The diagram/data show …, so … .

Draw and label all energy transfers across the boundary.

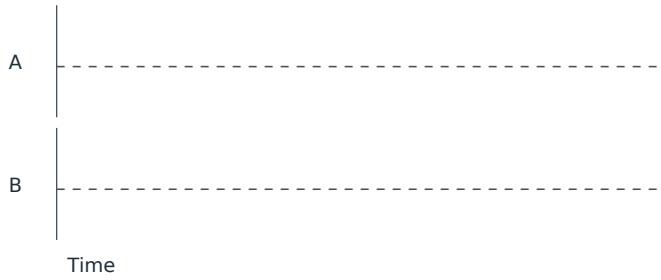

Stored energy change: _____ J

Marzano check - circle: ① ② ③

07 Exit check

Is sound in air mainly transverse or longitudinal?
State how particles move relative to propagation.

Sentence starter: I notice … . This supports … because … .

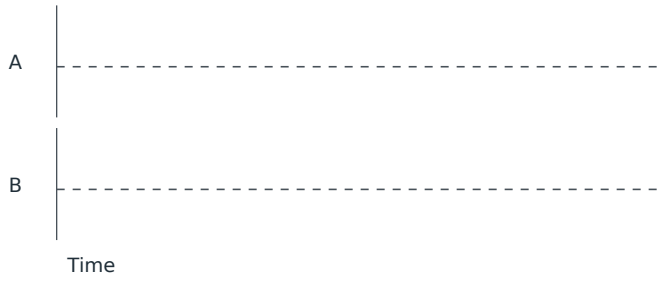

Marzano check - circle: ① ② ③

08 STRETCH: test the model

Design two sound changes: one changes pitch only and one changes amplitude only.
Describe how their graphs differ.

Sentence starter: Both … . They differ in … because … .

Marzano check - circle: ① ② ③
