Gears, motor and first power

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Compare a gear-based prediction with a supervised first powered test.

SUCCESS CRITERIA - I can...

1. Check gear mesh and secure connections before power.
2. Calculate ideal wheel speed from measured or supplied rpm.
3. Document first-test evidence and one revision.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “circumference” and “gear ratio” to compare your model or result. Sentence starters are optional.

circumference: distance around the edge of a circle

gear ratio: a comparison of gear tooth counts or rotation rates

assumption: a condition accepted for using a model

01 Warm-up: bring back an earlier idea

At unchanged wheel rpm, circumference becomes 3 times as large.
Compare ideal travel speed and state one real-world limitation.

Word help: ideal = using stated simplifying conditions

Sentence starter: Both ... . They differ in ... because ... .

Marzano check - circle: ① ② ③

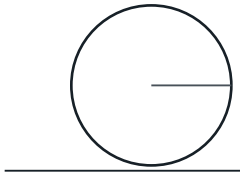

02 Worked example: explain the model

Reference: rotation rate = turns/Δt
v = circumference × rotation rate.
Turns per second, no slip. Get first-power approval; secure car and keep loose items clear. Disconnect before adjusting gears.

Worked reasoning: Supplied wheel tests show 4 rotations in 2 s. With circumference 0.20 m and no slip, predicted speed is (4/2)×0.20=0.40 m/s. Ground speed may differ if wheels slip.

Your turn: Draw one wheel rotation and the predicted travel distance.
Identify the no-slip assumption.

Sentence starter: I predict ... . My model supports this because ... .

Radius / diameter: ____

Turns per second: ____

Travel per turn: ____ Ground speed: ____

Marzano check - circle: ① ② ③

Gears, motor and first power

antocciphysics

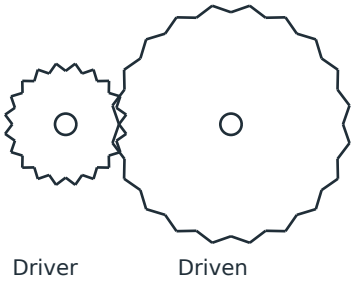

Continue down each column.

Sentence starters are optional. You may plan in any language.

03 Read and interpret the model

Sketch your driver and driven gears.
Label tooth counts and identify the driven axle. Note any rubbing or loose mesh before power.

Sentence starter: The ... in my model represents ... . Its label shows ... .

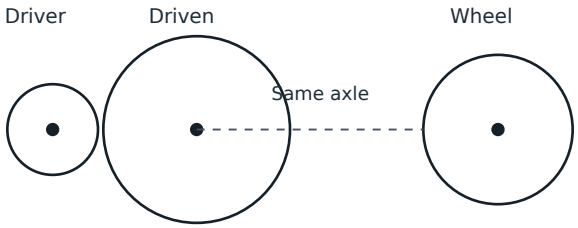

Marzano check - circle: 1 2 3

04 Apply the physics

A motor turns at 300 rpm. Its 10-tooth driver turns a 30-tooth driven gear, so the wheel rate is supplied as 100 rpm. The wheel circumference is 0.18 m.
Label the drivetrain and calculate ideal ground speed with no slip.

Word help: ideal = using stated simplifying conditions

Sentence starter: I found ... [unit]. This value means ... in this situation.

Label teeth, rotation rates and wheel size.

Marzano check - circle: 1 2 3

Gears, motor and first power

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Explain your reasoning

The actual car is slower than the prediction.
Name two assumptions to check and one measurement that could separate their effects.

Sentence starter: I predict … . My model supports this because … .

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

A consistently drawn magnetic-field map has 4 times as many field lines through the same small perpendicular area at A as at B. What does the denser spacing indicate?
Use field arrows and spacing to support your explanation.

Sentence starter: My design shows … . It meets the requirement by … .

N	S

Marzano check - circle: 1 2 3

07 Exit check

Record teacher approval, first-test observation and one next action.

Sentence starter: I notice … . This supports … because … .

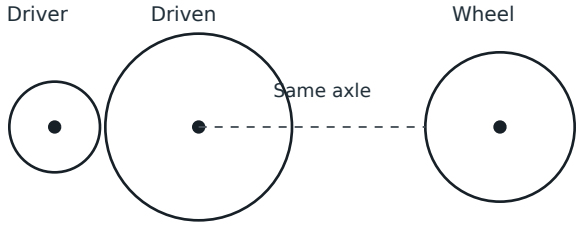

Checkpoint / measurement	Evidence	Next action
___	___	___

Marzano check - circle: 1 2 3

08 STRETCH: test the model

A car's wheels predict 0.40 m/s but measured ground speed is 0.30 m/s.
Name two hypotheses and a measurement to distinguish them.

Sentence starter: I predict … . My model supports this because … .

Label teeth, rotation rates and wheel size.

Marzano check - circle: 1 2 3
