Practice runs and evidence

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use repeated trials to prepare an evidence-based design explanation.

SUCCESS CRITERIA - I can...

1. Measure the actual course distance and run times.
2. Calculate average speed and describe variation.
3. Choose a final change supported by repeated evidence.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Warm-up: bring back an earlier idea

At unchanged wheel rpm, circumference becomes 5 times as large. Compare ideal travel speed and state one real-world limitation.

Marzano check - circle: ① ② ③

02 Worked example: explain the model

Reference: mean time = sum of trial times/number of trials
average speed = distance/time.
Measure course length; keep release and timing consistent.
Retain every trial and required build evidence.

Worked reasoning: Supplied 3 m runs take 2.0, 2.4, 2.1 s. Report all trials; their mean time is 2.17 s. “Fastest run 2.0 s” answers a different question from typical performance.

Your turn: Make a trial table and mark both mean and fastest time.

Trial	Distance (m)	Time (s)	Speed (m/s)
1	____	____	____
2	____	____	____
3	____	____	____

Marzano check - circle: ① ② ③

03 Read and interpret the model

Complete a final labeled sketch or attach a photo with labels. Identify a feature that supports straight motion and one that supports reliable electrical operation.

Marzano check - circle: ① ② ③

04 Apply the physics

A supplied practice run covers 4 m in 5 s. Calculate average speed. Then use the table for your own measured course length and three actual run times. Keep the sample calculation separate from your team’s data.

Trial	Distance (m)	Time (s)	Speed (m/s)
1	____	____	____
2	____	____	____
3	____	____	____

Marzano check - circle: ① ② ③

Practice runs and evidence

antocciphysics

Continue down each column.

05 Explain your reasoning

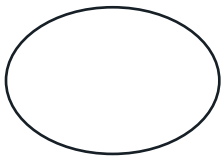

One run stops early after a loose connection. Should you erase it? Explain how to record it fairly and decide whether it belongs in a speed comparison.

Marzano check - circle: 1 2 3

06 Review: connect an earlier idea

A magnet moves through a 60-turn coil. Propose two controlled changes that could increase induced-emf magnitude and explain each.
Label the field or flux and identify what changes.

Label field direction, loop area and what changes.

Turns: ___ Time interval: ___ emf: ___

Marzano check - circle: 1 2 3

07 Exit check

Name the final design change you will keep and cite one specific observation or measurement supporting it.

Choice / claim	Actual evidence	Physics explanation
___	___	___
___	___	___

Marzano check - circle: 1 2 3

08 STRETCH: test the model

Return to the worked example in problem 2. Compare this set with 2.1, 2.1, 2.1 s. Discuss speed and consistency rather than declaring one winner from the fastest run alone.

Trial	Distance (m)	Time (s)	Speed (m/s)
1	___	___	___
2	___	___	___
3	___	___	___

Marzano check - circle: 1 2 3
