Choose a motion method

antocciphysics | TEACHER KEY | CPA + MATCHING SEI

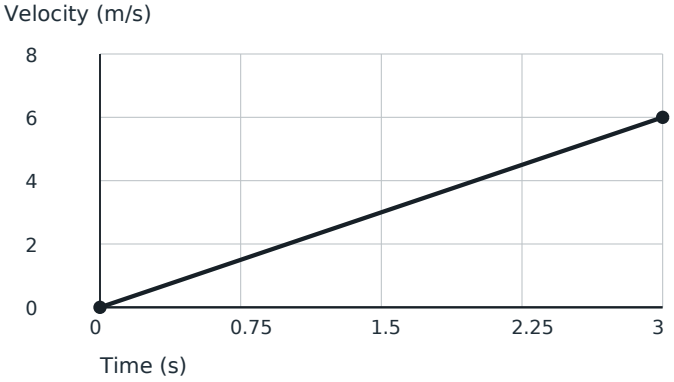

Learning target: Choose a motion relationship and justify its assumptions.

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 5.*
Central position 13 m; interval 11-15 m. Assumes steady velocity and the stated start.

02. Worked example: explain the model
Triangle base 3 s, height 6 m/s; area half of 18=9 m.

Model / diagram check

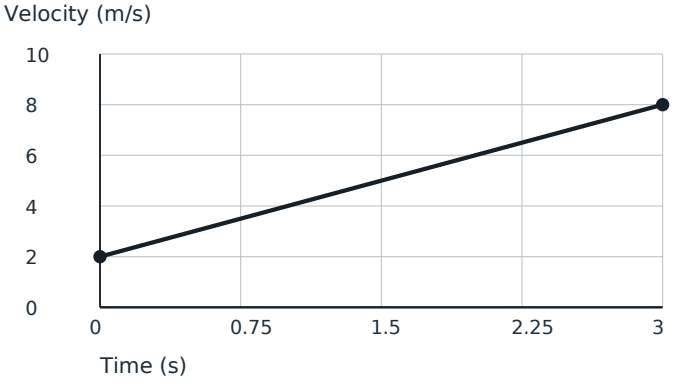

03. Choose the relationship
Steady velocity; 3×4=12 m.

04. Build final velocity
Gain 6 m/s; final 8 m/s east.

05. Find the distance while speeding up
Average 5 m/s east; displacement 15 m east.

Model / diagram check

06. Review: connect an earlier idea *Review: Unit 1, Day 7.*
Slowing down; change is 7 m/s east. Acceleration 3.5 m/s² east.

07. Exit check
a = (6 - 0)/5 = 1.2 m/s² east; average velocity = (0 + 6)/2 = 3 m/s east; displacement = 3 × 5 = 15 m east.

08. STRETCH: test the model
Steady 2 m/s; accelerating from 0 to 4 m/s. Both graph areas 8 m.

Choose a motion method

antocciphysics | TEACHER KEY | HONORS + MATCHING SEI

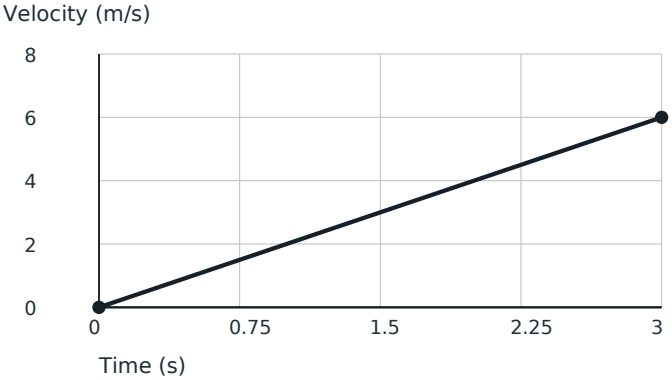

Learning target: Choose a motion relationship and justify its assumptions.

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 5.*
Central 32 m; half-width 1.2 m; interval [30.8, 33.2] m; full width 2.4 m. Constant velocity and bounded input ranges.

02. Worked example: explain the model
Triangle base 3 s, height 6 m/s; area half of 18=9 m.

Model / diagram check

03. Solve and check
v=6 m/s;Δx=8+8=16 m; final x=13 m.

04. No time given
0=144-6Δx;Δx=24 m; time 4 s; average 6 m/s×4=24 m.

05. At the top
Rise 10 m; time 14/9.8=1.43 s; acceleration remains 9.8 m/s² down.

06. Review: connect an earlier idea *Review: Unit 1, Day 7.*
First a=-4 m/s², speeding up. Then a=0, constant speed 15 m/s.

07. Exit check
Stops at 4 s after 24 m. Continued negative acceleration after rest would reverse it; ordinary braking ends the model at the stop.

08. STRETCH: test the model
24=8+8 a gives a=2 m/s². Average v=6, final v=10, so a=(10-2)/4=2. Initial speed alone is not average speed.
