Name the force and its source

antocciphysics | TEACHER KEY | CPA + MATCHING SEI

Learning target: Identify forces on a chosen object and name each interaction partner.

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 7.*
Slowing down; change is 8 m/s east. Acceleration 2.667 m/s² east.

02. Worked example: explain the model
Weight by Earth down; support by table up. Paired force is gravity by the book on Earth, not the support force.

03. Which object gets the force?
Earth exerts weight down; table exerts normal/support up. Equal magnitudes for rest.

04. Mass and weight
Weight 20 N down; rope tension 20 N up for rest.

05. After the throw
No hand contact; Earth’s gravity/weight acts down. Upward velocity is not an upward force.

06. Review: connect an earlier idea *Review: Unit 1, Day 9.*
The straight-moving rover can have zero net force. The turning rover changes velocity direction and needs net force.

07. Exit check
Earth on lamp 30 N down; cord on lamp 30 N up.

08. STRETCH: test the model
Add downward hand force. Upward support increases to balance weight plus hand force.

Name the force and its source

antocciphysics | TEACHER KEY | HONORS + MATCHING SEI

Learning target: Identify forces on a chosen object and name each interaction partner.

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 7.*
First a=-5 m/s², speeding up. Then a=0, constant speed 24 m/s.

02. Worked example: explain the model
Weight by Earth down; support by table up. Paired force is gravity by the book on Earth, not the support force.

03. Inventory the interactions
Weight = 49 N down from Earth; normal = 49 N up from the floor if vertical acceleration is zero. Rope tension acts right and kinetic friction left; their magnitudes need more information.

04. Mass and weight in two places
29.4 N and 4.8 N downward; mass stays 3.0 kg.

05. Normal is not always weight
N+12-49=0; N=37 N. Rope supplies part of upward support.

06. Review: connect an earlier idea *Review: Unit 1, Day 9.*
Tangent velocity direction changes, so acceleration and net force are inward and nonzero. Constant speed is insufficient for equilibrium.

07. Exit check
Weight 19.6 N down by Earth; tension 19.6 N up by string. Object-on-string acts on string, not object.

08. STRETCH: test the model
Weight 20 N down, hand 15 N down, normal 35 N up. Partners: book pulls Earth up, pushes hand up 15 N and table down 35 N.
