Diagnose, repair, recheck

antocciphysics | TEACHER KEY | CPA + MATCHING SEI

Learning target: Identify a reasoning error and demonstrate the repaired method on a new problem.

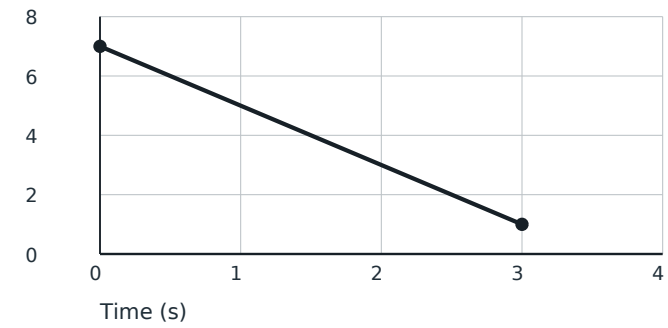

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 16.*
Net 21 N right; acceleration 7 m/s² right. Leftward motion initially slows.

02. Worked example: explain the model
Directions match while speeding up and oppose while slowing in straight-line motion; motion direction alone is insufficient.

03. Position is not velocity
Position change 6 m left in 3 s; velocity 2 m/s left.

Model / diagram check

04. Net force is not one force
Subtract opposing force first: 12 N right; 12/4=3 m/s² right.

05. New evidence
(a) v = (2 - 10)/7 = -8/7 ≈ -1.14 m/s, or 1.14 m/s left. (b) F_{net} = 7 - 22 = -15 N; a = -15/5 = -3 m/s², or 3 m/s² left.

06. Review: connect an earlier idea *Review: Unit 1, Day 7.*
Slowing down; change is 9 m/s east. Acceleration 2.25 m/s² east.

07. Exit check
Teacher looks for specific corrected method and evidence from new problem. Self-rating is reflection, not the teacher's mastery rating.

08. STRETCH: test the model
Example: zero net force means rest; counterexample steadily sliding puck. Zero net force means constant velocity.

Diagnose, repair, recheck

antocciphysics | TEACHER KEY | HONORS + MATCHING SEI

Learning target: Identify a reasoning error and demonstrate the repaired method on a new problem.

Accept equivalent correct methods and clearly labeled models. Language supports do not change the physics demand. Supplied data are examples; actual lab measurements and teacher checkpoints must be recorded from the lesson.

01. Warm-up: bring back an earlier idea *Review: Unit 1, Day 16.*
Downslope weight 14.7 N; net 6 N down; a=2 m/s² down. Normal force≈25.46 N.

02. Worked example: explain the model
Directions match while speeding up and oppose while slowing in straight-line motion; motion direction alone is insufficient.

03. Find the first bad step
v=(1-5)/2=-2 m/s; xf/t works for average velocity only if x i=0 and time is elapsed time.

04. Check the axis
Fx=-5 N; Fy=+8.66 N; angle is adjacent to north/y, west is negative.

05. Fresh recheck
Components (+6.93,-4.00) N; a=-3 m/s². Current velocity needed for motion direction.

06. Review: connect an earlier idea *Review: Unit 1, Day 7.*
First a=-6 m/s², speeding up. Then a=0, constant speed 35 m/s.

07. Exit check
Central 11 m; half-width 2 m; interval 9-13 m. Reflection must name a specific check, not just“double checked.”

08. STRETCH: test the model
Applied force 10 N; net 6 N; opposing force 4 N. Alternatives include incorrect moving mass, sensor calibration or nonconstant applied force; data needed.
