Build a complete prediction

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Connect net force, velocity change, and final position in one model.

SUCCESS CRITERIA - I can...

1. Connect force, acceleration and position consistently.
2. Show quantities and units at every stage.
3. Explain the assumptions and limits of the prediction.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Maximum static friction is 50 N. A 20 N push leaves a box still. Find actual friction. A 60 N push starts sliding with 40 N kinetic friction; find net force.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $a = \Sigma F/m$; $v_f = v_i + a\Delta t$; $x_f = x_i + \frac{1}{2}(v_i + v_f)\Delta t$. Constant acceleration; use one frame. i = initial; f = final. Apply each direction separately.

Worked reasoning: A 2 kg cart starts from rest under 6 N right and 2 N left for 2 s. Net force 4 N gives $a=2$ m/s². Its displacement is $\frac{1}{2}\times2\times2^2=4$ m right.

Your turn: Draw the force diagram and the matching velocity-time triangle. Check the 4 m using its area.

Marzano check - circle: ① ② ③

03 Start with forces

A 2 kg cart starts at rest. There are 6 N right and 2 N left. Find net force and acceleration.

The dot represents the object. Mass 2 kg; starts at rest

Marzano check - circle: ① ② ③

04 Predict motion

For the cart in 3, forces stay constant for 3 s. Find final velocity, average velocity, and displacement. If it starts at 1 m, find final position.

Marzano check - circle: ① ② ③

Build a complete prediction

antocciphysics

05 Explain a limit

Your prediction in 4 assumes constant net force. Name one change that would make that assumption fail. Describe whether more opposing friction would increase or decrease the predicted acceleration.

Marzano check - circle: 1 2 3

06 Choose a method

A cart accelerates uniformly from rest to 14 m/s east in 5 s. Find acceleration, average velocity and displacement.

Marzano check - circle: 1 2 3

07 Exit check

A 3 kg cart starts at rest with 9 N net force right for 2 s. Find acceleration and final velocity. State one assumption and one calculation you can explain.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Return to the worked example in problem 2. A second cart must cover the same 4 m in 2 s from rest but has twice the mass. What net force is required? Show your chain of reasoning.

Marzano check - circle: 1 2 3
