Vector addition

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Add displacement vectors and use a model to explain where an object ends up.

SUCCESS CRITERIA - I can...

1. Connect tip-to-tail diagrams to signed component sums.
2. Give magnitude, units and an angle with a named reference direction.
3. Check the result against the diagram, limits and physical situation.

Core: teacher selects from 1-10. **Stretch:** 11-12 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Retrieve and distinguish

A cart moves from 0 m to +6 m in 3 s, then to +2 m in 2 s. Find average speed and average velocity for the full trip. Sketch the route and explain why the answers differ.

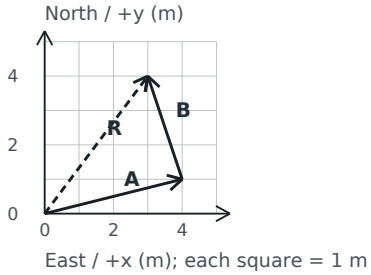

Marzano check - circle: ① ② ③

02 Explain a worked model

Reference: $R = \sqrt{(R_x^2 + R_y^2)}$.

Worked reasoning: East=+x; north=+y. R_x=4-1=3 m; R_y=1+3=4 m; $R=\sqrt{(3^2+4^2)}=5$ m.
$\theta=\tan^{-1}(4/3)=53.1°$ north of east.

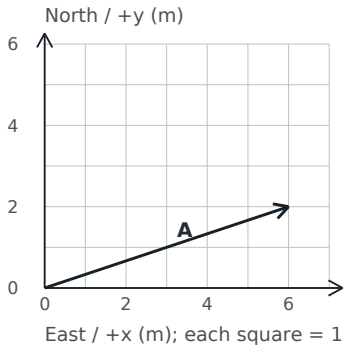

Your turn: Find B's westward component. Explain why R begins at the original start.

Marzano check - circle: ① ② ③

03 Complete, then check

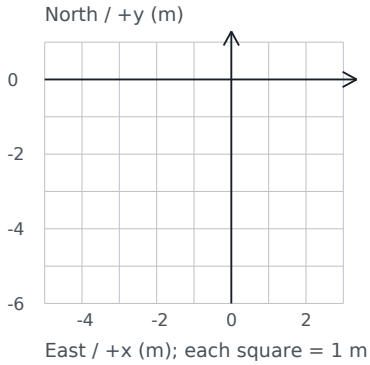

A=(6, 2) m; B=(-4, 3) m. A is drawn. Add B and R tip to tail; find R's components, magnitude and direction. Check the quadrant.

Marzano check - circle: ① ② ③

04 A different quadrant

A = (2, -5) m and B = (-6, 2) m. Predict the resultant quadrant. Draw tip to tail; calculate the components, magnitude and direction. State how you know your angle is in the correct quadrant.

Marzano check - circle: ① ② ③

05 Choose the correct component signs

A is 10 m at 30° north of east: A_x = 10 cos 30° = 8.66 m and A_y = 10 sin 30° = 5.00 m.
B is 6 m at 60° north of west. Sketch both arrows, resolve B into signed components, and find the resultant magnitude and direction.

Marzano check - circle: ① ② ③

06 The angle is measured from north

Walk 12 m at 25° east of north, then 7 m west. Sketch first and predict the resultant quadrant. Calculate components, magnitude and direction. Explain which component uses cosine and why.

Marzano check - circle: ① ② ③

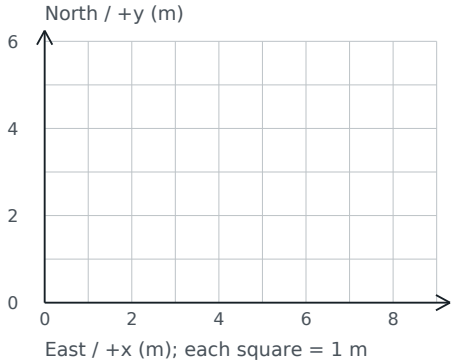

Vector addition

antocciphysics

Continue down each column.

07 Plan the direct return

A survey team walks 8 m east, 5 m north, then 2 m west. A clear field allows a straight return to the start. Find the route distance before returning and the direct return displacement, including magnitude and direction. Draw both the outward route and the return.

Marzano check - circle: 1 2 3

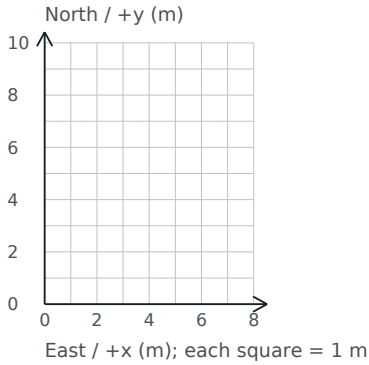

08 Diagnose the reasoning

A student adds 10 m east and 10 m at 60° north of east using $\sqrt{(10^2 + 10^2)} = 14.1$ m. Identify the violated condition. Draw a correct model and use it to repair the solution, including direction.

Marzano check - circle: 1 2 3

09 Represent one trip in several ways

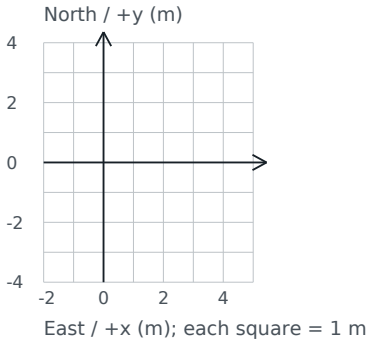

A robot moves steadily from (0, 0) m to (6, 0) m in 3 s, then steadily to (6, 8) m in another 4 s.
(a) Draw the path and resultant; find distance and displacement.
(b) Find average speed and the average-velocity vector for the full trip.
(c) Sketch x-versus-time and y-versus-time graphs. Explain how each graph records the same motion as your path diagram.

Marzano check - circle: 1 2 3

10 Exit check - solve without the worked model

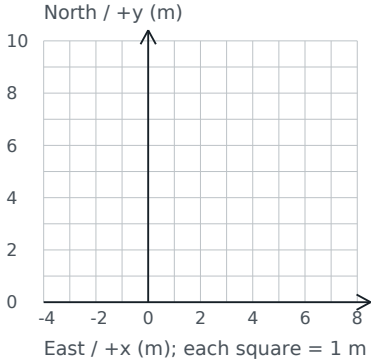

A = (4, -3) m and B = (-1, 5) m. Find R, its magnitude and direction. Choose C so A + B + C = 0. Draw a closed tip-to-tail route and give one physical or mathematical check of your answer.

Marzano check - circle: 1 2 3

11 STRETCH: Missing direction

The first displacement is 6 m east. The second has magnitude 10 m. Finish directly north of the start. Find the second vector's components and direction, and the resultant. Draw the model. Explain whether more than one solution meets the north requirement.

Marzano check - circle: 1 2 3

12 STRETCH: Decide what is possible

Two displacements have magnitudes 5 m and 3 m. Test whether resultants of 1 m, 6 m and 9 m are possible using limits. Draw the 6 m case to scale. Estimate the angle between the original arrows with tails together. Explain why the tip-to-tail triangle uses a different interior angle. Optional: derive an angle-resultant relationship to check your drawing.

Marzano check - circle: 1 2 3
