Inertia and balanced forces

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Predict motion when the net force is zero.

SUCCESS CRITERIA - I can...

1. Add forces to decide whether they balance.
2. Predict constant velocity when net force is zero.
3. Explain why changing direction requires net force.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A=(6, -4) m and B=(-4, 8) m. Find R, magnitude and direction. Choose C so A+B+C=0 and sketch the route.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: ΣF = 0 ⇒ a = 0 ⇒ v = constant.
ΣF means net force. Balanced forces allow rest or steady motion in a straight line.

Worked reasoning: A book has 6 N upward support and 6 N downward weight. Net force is zero. Its velocity stays constant; it could be resting or moving steadily.

Your turn: Draw the two force arrows. Then sketch two possible velocity-time graphs consistent with this balance.

Marzano check - circle: ① ② ③

03 Infer the motion constraint

A 4 kg cart experiences 6 N right and 6 N left. It currently moves at -3 m/s. Find acceleration and its displacement during the next 5 s.

The dot represents the object. Velocity: 3 m/s left

Marzano check - circle: ① ② ③

04 Inertia in a braking bus

Explain a passenger's forward motion relative to a braking bus using an approximately inertial ground frame. Identify the external interaction that changes passenger velocity.

Marzano check - circle: ① ② ③

Inertia and balanced forces

antocciphysics

Continue down each column.

05 Engine-off spacecraft

A probe moves with v=(4,-3) km/s in an ideal zero-net-force region. Predict its displacement after 10 s and magnitude. Explain why an engine is unnecessary.

Marzano check - circle: 1 2 3

06 Choose a method

A car starts at +15 m/s and brakes at -3 m/s² until rest. A student extends that acceleration to 7 s. Find the stop time/distance and explain why extension is invalid for ordinary braking.

Marzano check - circle: 1 2 3

07 Exit check

An object moves around a circular path at constant speed. A classmate claims equilibrium because the speed does not change. Correct the claim using velocity.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

An elevator moves upward at 2 m/s with zero acceleration. Its mass is 500 kg; use g=10 N/kg. Find cable tension. Sketch a second case with the same motion direction but lower tension and describe the speed trend.

Marzano check - circle: 1 2 3
