Independent projectile directions

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain why horizontal and vertical projectile motion share time but evolve differently.

SUCCESS CRITERIA - I can...

1. Identify horizontal and vertical velocity components.
2. Use the same elapsed time for both axes.
3. State the negligible-air-resistance assumption.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A 3 kg test mass feels 15 N toward a source. Find g and the force on a 7 kg mass at the same point.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $a_x = 0$; $a_y = -g$; v_x = constant.
Upward positive; g = 10 m/s². Ideal near-Earth motion with negligible air resistance.

Worked reasoning: A ball launches horizontally at 3 m/s and falls for 2 s. Horizontal travel is 3×2=6 m. With g=10 m/s² and no initial vertical velocity, its final vertical velocity is 20 m/s down.

Your turn: Draw separate horizontal and vertical velocity arrows at launch and after 2 s.

Marzano check - circle: ① ② ③

03 Look and explain

One ball is dropped and another launched horizontally from the same height at the same instant. Compare fall times and explain.

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

04 Build the solution

A horizontal launch has v_x=3 m/s and stays in air 2 s. Find horizontal travel. What happens ifv_x doubles but height stays the same?

Marzano check - circle: ① ② ③

Independent projectile directions

antocciphysics

Continue down each column.

05 Use the idea

A student says a larger horizontal speed holds the ball up longer. Explain which force or acceleration would be needed for that claim.

Marzano check - circle: 1 2 3

06 Choose a method

A student says a 4 kg cart under 24 N net force accelerates at 96 m/s². Identify the error, correct it and name a check you can now do independently.

Marzano check - circle: 1 2 3

07 Exit check

Two horizontal launches from the same height have speeds 2 and 6 m/s. Compare fall times and ranges.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Two balls launch horizontally from the same platform at 2 and 5 m/s. Their shared fall time is 3 s. Draw paths and compare ranges.

Marzano check - circle: 1 2 3
