Angled launches

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use components to analyze an angled projectile.

SUCCESS CRITERIA - I can...

1. Separate the initial velocity into two components.
2. Use vertical motion to determine flight time.
3. Explain the assumptions behind range comparisons.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Downward velocity changes from 3 to 8 m/s in 0.5 s. Find acceleration and name one possible measurement uncertainty.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $t_{top} = v_{y,i}/g$; $t_{flight} = 2\,v_{y,i}/g$; range = $v_x\,t_{flight}$. Upward initial component $v_{y,i}$; g = 10 m/s². Equal launch/landing height and no air resistance; CPA components are supplied.

Worked reasoning: A projectile has initial components 4 m/s horizontal and 10 m/s upward. With g=10 m/s² it reaches the top in 1 s and returns to launch height in 2 s; range=8 m.

Your turn: Sketch its path and velocity arrows at launch, top and return.

Marzano check - circle: ① ② ③

03 Look and explain

At the highest point, which velocity component is zero and which remains? Is acceleration zero?

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

04 Build the solution

Components are supplied: v_x=6 m/s, $v_{y,i}$=10 m/s up. Find time to top, total flight time and range using the reference box.

Marzano check - circle: ① ② ③

Angled launches

antocciphysics

Continue down each column.

05 Use the idea

Why is doubling time to the top valid only when the projectile returns to launch height in this ideal model?

Marzano check - circle: 1 2 3

06 Choose a method

A 7 kg cart starts from rest under 63 N net force right for 6 s. Find acceleration and final velocity. State one assumption.

Marzano check - circle: 1 2 3

07 Exit check

Given v_x=4 m/s, $v_{y,i}$=15 m/s up, find time to top and total flight time to launch height.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Return to the worked example in problem 2. Keep the upward component 10 m/s but double the horizontal component. Compare flight time, maximum height and range.

Marzano check - circle: 1 2 3
