Horizontal launches

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Find flight time from vertical motion and then horizontal range.

SUCCESS CRITERIA - I can...

1. Separate vertical and horizontal givens.
2. Find or use fall time before calculating range.
3. Check units and interpret the landing point.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

At what altitude h/R is a spherical planet's field 1/9 of its surface value? Repeat for 1/25.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $h = \frac{1}{2}gt^2$; range = $v_x t$.
Horizontal launch; h is the positive drop, t is fall time; g = 10 m/s². CPA may use the supplied time.

Worked reasoning: A horizontal launch falls 20 m with g=10 m/s². From $20=5\ t^2$, t=2 s. At horizontal speed 3 m/s, range=6 m.

Your turn: Draw a diagram labeling height and range. Number the two solution steps to show why time comes first.

Marzano check - circle: ① ② ③

03 Represent and interpret

On the diagram, label height h, horizontal range and initial horizontal velocity. Which direction determines the fall time?

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

04 Solve and justify

A ball launches horizontally at 15 m/s from a 45 m cliff. Find flight time and range.

Marzano check - circle: ① ② ③

Horizontal launches

antocciphysics

Continue down each column.

05 Analyze the reasoning

Two platforms have heights 5 and 20 m. Supplied fall times are 1 and 2 s. At the same launch speed, does quadrupling height quadruple range? Explain.

Marzano check - circle: 1 2 3

06 Choose a method

A toy model predicts position (-60, 80) km with bounds ±6 km in x and ±8 km in y. Write a short briefing giving both intervals and two reasons it is not a real asteroid collision forecast.

Marzano check - circle: 1 2 3

07 Exit check

From a 20 m cliff, horizontal launch speed is 8 m/s. Find t, range and final vertical velocity.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A horizontal launch at 12 m/s must land 18 m from the base. Find launch height and impact speed using g=10 m/s^2.

Marzano check - circle: 1 2 3
