Angled launches

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use components to analyze an angled projectile.

SUCCESS CRITERIA - I can...

1. Separate the initial velocity into two components.
2. Use vertical motion to determine flight time.
3. Explain the assumptions behind range comparisons.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A downward-velocity fit goes from 0.3 m/s at 0.01 s to 3.24 m/s at 0.31 s. Find g and explain why fitting an interval can be better than one noisy point.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $v_{x,\,i} = v_i \cos\theta$; $v_{y,\,i} = v_i \sin\theta$; $t_{flight} = 2\,v_{y,\,i}/g$
range = $v_{x,\,i}\,t_{flight}$.
θ above horizontal; g = 10 m/s². Equal launch/landing height; no air resistance.

Worked reasoning: A projectile has initial components 4 m/s horizontal and 10 m/s upward. With g=10 m/s² it reaches the top in 1 s and returns to launch height in 2 s; range=8 m.

Your turn: Sketch its path and velocity arrows at launch, top and return.

Marzano check - circle: ① ② ③

03 Represent and interpret

At the highest point, which velocity component is zero and which remains? Is acceleration zero?

Add velocity / acceleration arrows.

Marzano check - circle: ① ② ③

04 Solve and justify

Launch speed 20 m/s at 30° above horizontal. Resolve components; find total time, range and maximum height.

Marzano check - circle: ① ② ③

Angled launches

antocciphysics

Continue down each column.

05 Analyze the reasoning

Why is doubling time to the top valid only when the projectile returns to launch height in this ideal model?

Marzano check - circle: 1 2 3

06 Choose a method

A toy model predicts position (-70, 90) km with bounds ±7 km in x and ±9 km in y. Write a short briefing giving both intervals and two reasons it is not a real asteroid collision forecast.

Marzano check - circle: 1 2 3

07 Exit check

For speed 20 m/s, compare ranges at 30° and 60° on level ground. Explain which has longer flight time.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

For a launch at 20 m/s from level ground, find the two angles giving an ideal range of 20 m with $g=10\ m/s^2$. Compare flight times.

Marzano check - circle: 1 2 3
