Kinds of collisions

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Separate momentum conservation from kinetic-energy conservation.

SUCCESS CRITERIA - I can...

1. Identify the system and external-impulse assumption.
2. Recognize sticking as perfectly inelastic.
3. Use kinetic energy to distinguish elastic from inelastic.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “collision” and “elastic” to explain your model or result. Sentence starters are optional.

collision: an interaction during which objects exert forces on each other

elastic: a collision that conserves total kinetic energy

inelastic: a collision that transforms some kinetic energy to other forms

01 Bring back an earlier idea

A 15 N net force acts right for 2 s on a 3 kg cart initially at rest.
Find impulse and final velocity.

Word help: impulse = net force acting over time; change in momentum

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $p_{total,\,i} = p_{total,\,f}$; $K = \frac{1}{2}mv^2$.
Negligible external impulse. Elastic collisions also have $K_{total,\,i} = K_{total,\,f}$; sticking transforms some kinetic energy.

Worked reasoning: A 1 kg cart at 4 m/s joins a 1 kg cart at rest. Initial momentum is 4 kg·m/s. Together, 2 kg move at 2 m/s; sticking is one possible collision outcome.

Your turn: Draw before and after snapshots with masses and velocities.

Sentence starter: The … in my model represents … . Its label shows … .

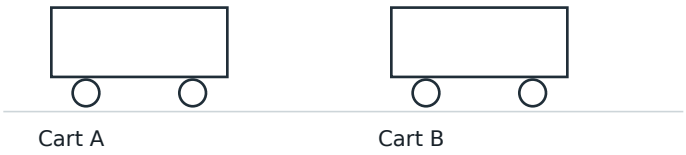

Marzano check - circle: ① ② ③

03 Look and explain

Sketch before/after for a collision where two carts stick. **Label** one common final velocity, not two different final velocities.

Sentence starter: Both … . They differ in … because … .

Before contact: add velocity arrows.

Marzano check - circle: ① ② ③

04 Build the solution

A 2 kg cart at 3 m/s hits and sticks to a 1 kg cart at rest. Total initial momentum=6 kg·m/s. Divide by combined mass to find final speed.

Word help: at rest = not moving in the chosen reference frame

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Kinds of collisions

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Use the idea

A classmate says energy is destroyed in an inelastic collision. Rewrite the claim accurately.

Sentence starter: I notice … . This supports … because … .

Marzano check - circle: 1 2 3

06 Choose a method

A ball launched horizontally at 7 m/s stays airborne 5 s. **Find** its landing point measured horizontally from the platform base.

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3

07 Exit check

Which description guarantees perfectly inelastic: bouncing apart or sticking together? Which quantity still conserves for an isolated system?

Sentence starter: I notice … . This supports … because … .

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Return to the worked example in problem 2. Could the same initial carts finish with the first stopped and the second at 4 m/s?
Check momentum and explain why momentum alone cannot select between these outcomes.

Sentence starter: My claim is … . The diagram/data show …, so … .

Marzano check - circle: 1 2 3
