Momentum analysis: put it together

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use a model to compare a deflection option and its limits.

SUCCESS CRITERIA - I can...

1. Compute the required change before evaluating an option.
2. Keep impulse, velocity change and displacement distinct.
3. Communicate assumptions with the numerical result.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “deflection” and “lead time” to compare your model or result. Sentence starters are optional.

deflection: a change in the direction or path of motion

lead time: time available before the modeled event

system: the object or objects chosen for analysis

01 Bring back an earlier idea

A system’s total momentum is 15 kg·m/s west and 21 kg·m/s south. Its combined mass is 3 kg.
Find final velocity components.

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: shift = Δv × time; J = MΔv.
Fictional straight-line planning model. M is target mass; J is required impulse. This is not a real encounter forecast.

Worked reasoning: A 1 kg cart at +6 m/s sticks to a 2 kg cart at rest. Final velocity is +2 m/s. The moving cart changes momentum by -4 and the other by +4 kg·m/s.

Your turn: Draw both momentum changes and show how their sum matches the system change.

Sentence starter: The … in my model represents … . Its label shows … .

Marzano check - circle: ① ② ③

03 Look and explain

Organize this chain with units: impulse → velocity change → sideways shift. Which step uses target mass?

Sentence starter: I notice … . This supports … because … .

Marzano check - circle: ① ② ③

04 Build the solution

A 100 kg model target needs a 2 m sideways shift in 20 s. FindΔv=2÷20, then impulse=100×Δv.

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Momentum analysis: put it together

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Use the idea

If the target mass estimate is too low, how would a fixed delivered impulse’s velocity change compare with the prediction?

Word help: estimate = find an approximate value

Sentence starter: Both … . They differ in … because … .

Marzano check - circle: 1 2 3

06 Choose a method

A 4 kg cart moving at 6 m/s stops in 3 s.
Find momentum-change magnitude and average stopping-force magnitude.

Word help: momentum = mass times velocity, including direction

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3

07 Exit check

A model deliversΔv=.2 m/s for 50 s.
Find shift and name one assumption.

Sentence starter: My claim is … . The diagram/data show …, so … .

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Return to the worked example in problem 2. The same pair now receives an external impulse of 3 N·s right during contact.
Find final total momentum and shared velocity.

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3
