What momentum says about impact

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Connect stopping impulse to average force without claiming a complete damage forecast.

SUCCESS CRITERIA - I can...

1. Compute momentum change during a stop.
2. Compare average force for different stopping times.
3. Name information beyond momentum needed for damage.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Equal-mass carts have velocities +5 and -3 m/s before an ideal 1 D elastic collision. Give both final velocities.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $p = mv$; $|F_{avg}| = |\Delta p|/\Delta t$.
Stopping force depends on stopping time as well as momentum. These quantities alone do not specify damage.

Worked reasoning: Two incoming objects have equal momentum 12 kg·m/s but masses 2 and 4 kg, so their speeds are 6 and 3 m/s. Momentum alone does not identify every possible consequence of stopping them.

Your turn: Draw equal momentum arrows and unequal velocity arrows.

Marzano check - circle: ① ② ③

03 Look and explain

Two equal-momentum objects stop in .1 s and 1 s. Which has greater average force magnitude, and by what factor?

Marzano check - circle: ① ② ③

04 Build the solution

A 10 kg model object moves at 4 m/s and stops in 4 s. Find initial momentum and average stopping force size.

Marzano check - circle: ① ② ③

05 Use the idea

Why is a single stopping-force number not a prediction of buildings damaged by an asteroid?

Marzano check - circle: ① ② ③

06 Choose a method

A planet has surface field 144 N/kg. At center distance 6 R, find field and the force on a 8 kg object.

Marzano check - circle: ① ② ③

07 Exit check

If mass doubles while speed and stopping time stay fixed, how do momentum and average stopping force change?

Marzano check - circle: ① ② ③

08 STRETCH: Apply it another way

Return to the worked example in problem 2. Both objects stop in 0.5 s. Compare their average stopping forces. Explain why this does not establish identical peak forces or damage.

Marzano check - circle: ① ② ③
