Momentum analysis: put it together

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use a model to compare a deflection option and its limits.

SUCCESS CRITERIA - I can...

1. Compute the required change before evaluating an option.
2. Keep impulse, velocity change and displacement distinct.
3. Communicate assumptions with the numerical result.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A system's total momentum is 15 kg·m/s west and 21 kg·m/s south. Its combined mass is 3 kg. Find final velocity components.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: shift = Δv × time; J = MΔv.
Fictional straight-line planning model. M is target mass; J is required impulse. This is not a real encounter forecast.

Worked reasoning: A 1 kg cart at +6 m/s sticks to a 2 kg cart at rest. Final velocity is +2 m/s. The moving cart changes momentum by -4 and the other by +4 kg·m/s.

Your turn: Draw both momentum changes and show how their sum matches the system change.

Marzano check - circle: ① ② ③

03 Look and explain

Organize this chain with units: impulse → velocity change → sideways shift. Which step uses target mass?

Marzano check - circle: ① ② ③

04 Build the solution

A 100 kg model target needs a 2 m sideways shift in 20 s. FindΔv=2÷20, then impulse=100×Δv.

Marzano check - circle: ① ② ③

05 Use the idea

If the target mass estimate is too low, how would a fixed delivered impulse's velocity change compare with the prediction?

Marzano check - circle: ① ② ③

06 Choose a method

A 4 kg cart moving at 6 m/s stops in 3 s. Find momentum-change magnitude and average stopping-force magnitude.

Marzano check - circle: ① ② ③

07 Exit check

A model deliversΔv=.2 m/s for 50 s. Find shift and name one assumption.

Marzano check - circle: ① ② ③

08 STRETCH: Apply it another way

Return to the worked example in problem 2. The same pair now receives an external impulse of 3 N·s right during contact. Find final total momentum and shared velocity.

Marzano check - circle: ① ② ③
