What momentum says about impact

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Connect stopping impulse to average force without claiming a complete damage forecast.

SUCCESS CRITERIA - I can...

1. Compute momentum change during a stop.
2. Compare average force for different stopping times.
3. Name information beyond momentum needed for damage.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Two 3 kg carts at +5 and -3 m/s stick. Find final velocity and use kinetic energy to explain why this is not elastic.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $p = mv$; $|F_{avg}| = |\Delta p|/\Delta t$.
Stopping force depends on stopping time as well as momentum. These quantities alone do not specify damage.

Worked reasoning: Two incoming objects have equal momentum 12 kg·m/s but masses 2 and 4 kg, so their speeds are 6 and 3 m/s. Momentum alone does not identify every possible consequence of stopping them.

Your turn: Draw equal momentum arrows and unequal velocity arrows.

Marzano check - circle: ① ② ③

03 Represent and interpret

Two equal-momentum objects stop in .1 s and 1 s. Which has greater average force magnitude, and by what factor?

Marzano check - circle: ① ② ③

04 Solve and justify

A hypothetical object of mass 10^6 kg at 200 m/s stops in .50 s. Find impulse and average force magnitude. Then compare a 5 s stop.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

What momentum says about impact

antocciphysics

Continue down each column.

05 Analyze the reasoning

Why is a single stopping-force number not a prediction of buildings damaged by an asteroid?

Marzano check - circle: 1 2 3

06 Choose a method

An ideal circular orbit has GM=576 m^3/s^2 and r=16 m. Find speed, inward acceleration and period; explain how velocity changes.

Marzano check - circle: 1 2 3

07 Exit check

Objects A and B have equal momentum. A has twice B’s mass. Compare speeds and kinetic energies, showing why equal momentum need not mean equal energy.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 0.5 kg ball arrives at +10 m/s and either stops or rebounds at -6 m/s in 0.04 s. Compare impulse and average force.

Marzano check - circle: 1 2 3
