Sliding, swinging and rolling

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose the energy terms that match the type of motion.

SUCCESS CRITERIA - I can...

1. Distinguish translational and rotational kinetic energy.
2. Use equal height changes to compare ideal energy changes.
3. State when a simple point-mass model is insufficient.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Lift a 4 kg object by 6 m. Use g=10 N/kg. Find the change in gravitational potential energy.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $K_{translation} = \frac{1}{2}mv^2$; $K_{total} = K_{translation} + K_{rotation}$. A rolling object also rotates. Track all energy forms; an ideal pendulum exchanges gravitational and kinetic energy.

Worked reasoning: An object loses 20 J of gravitational potential energy. If 8 J becomes rotational kinetic energy and losses are negligible, only 12 J becomes translational kinetic energy.

Your turn: Draw three energy bars and explain why assigning all 20 J to forward speed would be wrong.

Marzano check - circle: ① ② ③

03 Look and explain

A slider and a rolling wheel start at the same height from rest. Why can the wheel reach the bottom with a lower center speed?

Marzano check - circle: ① ② ③

04 Build the solution

A system loses 20 J of potential energy. Case A puts all 20 J into translation. Case B puts 5 J into rotation. How much translation energy is left in B?

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Sliding, swinging and rolling

antocciphysics

Continue down each column.

05 Use the idea

A pendulum’s tension is perpendicular to its instantaneous motion in the ideal fixed-length model. What work does tension do, and which interaction changes K?

Marzano check - circle: 1 2 3

06 Choose a method

A toy deflection adds 0.4 m/s sideways for a lead time of 60 s. Find the modeled shift and name an assumption.

Marzano check - circle: 1 2 3

07 Exit check

Why should a rolling-wheel energy diagram include more than translational kinetic energy?

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Compare a sliding object and a rolling object from the same height with no losses. Explain why equal total energy need not give equal center-of-mass speeds.

Marzano check - circle: 1 2 3
