Spring potential energy

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Calculate stored spring energy and distinguish it from force.

SUCCESS CRITERIA - I can...

1. Use displacement in meters.
2. Apply the squared relationship for spring energy.
3. Explain how stored energy can become motion.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “compression” and “spring constant” to compare your model or result. Sentence starters are optional.

compression: shortening or squeezing relative to an unstressed length

spring constant: how much an ideal spring’s force changes per stretch

potential energy: energy associated with the configuration of interacting objects

01 Bring back an earlier idea

A cart starts from rest at height 3 m. Can it reach 5 m with no external energy input or losses? Justify using kinetic energy.

Word help: kinetic energy = energy associated with motion

Sentence starter: Under the assumption ..., the evidence ... supports ... because ... .

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $U_s = \frac{1}{2}kx^2$; $|F_{spring}| = k|x|$.
s means spring. Compression and stretch both store energy relative to the natural length; energy and force are different quantities.

Worked reasoning: A spring with k=200 N/m stretched 0.10 m stores $\frac{1}{2}kx^2$=1 J. Doubling stretch to 0.20 m stores 4 J, not 2 J.

Your turn: Draw force-versus-stretch triangles and compare their areas.

Sentence starter: Both ... . They differ in ... because ... .

Marzano check - circle: ① ② ③

03 Represent and interpret

The same spring is displaced x and 2 x.
Compare stored energies and force magnitudes.

Sentence starter: Both ... . They differ in ... because ... .

Mark equilibrium and displacement x.

The zigzag is the spring; the rectangle is the attached block.

Marzano check - circle: ① ② ③

04 Solve and justify

A spring with k=200 N/m is compressed .10 m and launches a .50 kg cart on an ideal frictionless surface.
Find stored energy and speed after release.

Word help: ideal = using stated simplifying conditions

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

Spring potential energy

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Analyze the reasoning

Why is energy positive for both positive and negative x even though spring force reverses?

Sentence starter: Under the assumption …, the evidence … supports … because … .

Marzano check - circle: 1 2 3

06 Choose a method

A 8 N force acts at 120° to a 6 m displacement.
Calculate its work and explain the sign.

Word help: work = energy transferred by a force along a displacement

Sentence starter: Under the assumption …, the evidence … supports … because … .

Marzano check - circle: 1 2 3

07 Exit check

k=80 N/m; stored energy .40 J.
Find displacement magnitude and force magnitude.

Word help: magnitude = size of a quantity without its direction

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 0.5 kg cart is launched by a spring k=400 N/m compressed 0.15 m with no losses.
Find release speed. What compression doubles that speed?

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3
