Work-energy lab

antocciphysics

UNIT 4 / DAY 6 / HONORS

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Compare measured work with kinetic-energy change.

SUCCESS CRITERIA - I can...

1. Find work from force-displacement area.
2. Calculate kinetic energy from measured mass and speed.
3. Discuss disagreements without inventing measurements.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A 6 N force acts at 120° to a 5 m displacement. Calculate its work and explain the sign.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $W = F_{parallel}\, d$; $W_{net} = \Delta K$.
Constant force for the first equation; otherwise use signed force-displacement area. Use the approved cart setup and record actual trials separately.

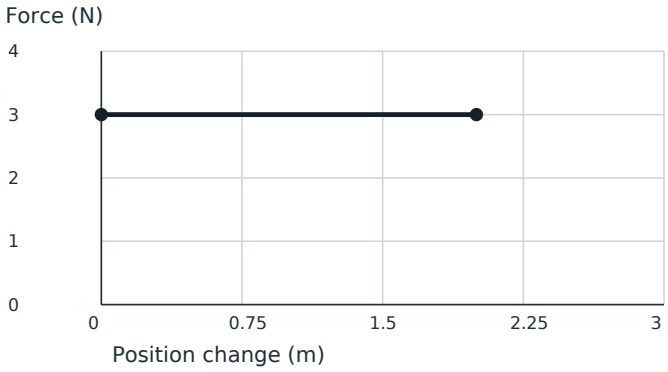

Worked reasoning: Supplied measurements give net work 12 J and kinetic-energy change 11 J. Their 1 J difference could reflect uncertainty or omitted work; it is evidence to investigate.

Your turn: Draw two bars for these measurements and label one check of the experiment.

Marzano check - circle: ① ② ③

03 Represent and interpret

The supplied force-displacement graph stays at 3 N over 2 m. Calculate work.

Marzano check - circle: ① ② ③

04 Solve and justify

A .50 kg cart changes from .40 to 1.20 m/s. Measured pulling work is .35 J. Find ΔK and estimate work by unmeasured resistance if other effects are negligible.

Marzano check - circle: ① ② ③

05 Analyze the reasoning

Create a trial table with mass, initial/final speed, work and ΔK. Name two causes of disagreement that deserve checking.

Marzano check - circle: 1 2 3

06 Choose a method

A 0.4 kg projectile at 60 m/s sticks to a stationary 3.6 kg cart. Find common speed and the fraction of initial kinetic energy remaining.

Marzano check - circle: 1 2 3

07 Exit check

A force rises linearly from 0 to 8 N over .50 m. Find work. If a 1 kg cart begins at rest and this is net work, find final speed.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 2 kg cart speeds from 1 to 3 m/s while measured pulling work is 10 J. Infer friction work and mean friction magnitude over 2 m if other work is zero.

Marzano check - circle: 1 2 3
