Transfer: energy and work

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose and justify energy methods in new physical situations.

SUCCESS CRITERIA - I can...

1. Choose the correct energy terms and units.
2. Show a consistent numerical balance.
3. Explain model assumptions and limitations.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

At fixed speed, mass becomes 3 times as large while energy-coupling fraction becomes 1/5 as large. Compare coupled energy.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $W_{net} = \Delta K$; $K = \frac{1}{2}mv^2$; $U_g = mgh$; $U_s = \frac{1}{2}kx^2$
$P = W/\Delta t$.
$g = 10$ N/kg where needed. Select relationships for the stated system and conditions.

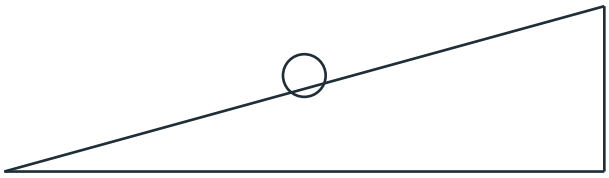

Worked reasoning: A 2 kg cart drops 2 m with$g=10$, then loses 10 J to friction. From rest, its final kinetic energy is $40-10=30$ J, so speed$\sqrt{30}\approx5.48$ m/s.

Your turn: Draw a complete energy account and a sketch identifying where friction acts.

Marzano check - circle: ① ② ③

03 Represent and interpret

A cart coasts down a frictionless ramp from rest. Explain which energy decreases and which increases. Mark the vertical height in the sketch.

The marker represents the object on the sloping surface.

Marzano check - circle: ① ② ③

04 Solve and justify

A 2 kg cart starts at rest 3 m high, reaches bottom with 4 m/s, and compresses a 200 N/m spring on a frictionless level section. Find energy lost on the way down and max compression.

Marzano check - circle: ① ② ③

Transfer: energy and work

antocciphysics

Continue down each column.

05 Analyze the reasoning

A motor supplies 100 J while the load gains 70 J mechanical energy. Explain where the other 30 J might go and whether energy was destroyed.

Marzano check - circle: 1 2 3

06 Choose a method

A ball is thrown vertically upward at 20 m/s from h=0. Use g=10 and neglect drag. Find maximum height by energy.

Marzano check - circle: 1 2 3

07 Exit check

A toy source has GM=200 m^3/s^2. At r=4 m, find escape speed and state two assumptions.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 3 kg cart starts at 2 m/s, drops 1 m, then compresses a spring k=200 N/m. Friction removes 11 J before maximum compression; g=10. Find compression and check the final energy account.

Marzano check - circle: 1 2 3
