The second law

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain the direction of heat transfer and the limits of energy conversion.

SUCCESS CRITERIA - I can...

1. Predict spontaneous net heat flow.
2. Explain why moving heat from cold to hot needs an additional process.
3. Distinguish energy conservation from process direction.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Samples at 13°C and 55°C are mixed with no energy input or phase change. A student reports 67°C at equilibrium. Is that plausible? Explain.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $Q_{hot} = Q_{cold} + W_{in}$.
Refrigerator cycle: heat amounts are positive magnitudes. Work input moves heat from cold to hot; spontaneous flow is hot to cold.

Worked reasoning: Hot and cold blocks in contact exchange energy until thermal equilibrium. Total energy can be conserved while the temperature difference and ability to drive a heat engine decrease.

Your turn: Draw before-and-after temperature states and the spontaneous heat-flow direction.

Marzano check - circle: ① ② ③

03 Look and explain

A 50°C block touches a 10°C block. Draw net heat flow and predict their trend toward equilibrium.

50°C 10°C

Each outline represents the labeled sample or container.

Marzano check - circle: ① ② ③

04 Build the solution

A refrigerator removes 20 J from its cold space and receives 5 J electrical work. How much energy is released to the room?

Marzano check - circle: ① ② ③

05 Use the idea

A proposed machine takes heat from one reservoir and turns all of it into work in a repeating cycle. What thermodynamic limitation is missing?

Marzano check - circle: 1 2 3

06 Choose a method

An energy account begins with 24 J. It ends with 16 J motion energy and 4 J thermal energy. Find the unaccounted energy and suggest a next check.

Marzano check - circle: 1 2 3

07 Exit check

Does a refrigerator disprove hot-to-cold spontaneous flow? Explain the role of work input.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A refrigerator moves energy from colder inside air to warmer room air. Explain why this does not contradict the usual spontaneous heat-flow direction.

Marzano check - circle: 1 2 3
