Conduction, convection, radiation

antocciphysics

UNIT 5 / DAY 3 / HONORS

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Identify mechanisms of heat transfer and support each classification.

SUCCESS CRITERIA - I can...

1. Describe contact transfer, bulk fluid motion and electromagnetic transfer.
2. Use evidence from the situation.
3. Recognize that more than one mechanism can act.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A toy source has GM=150 m^3/s^2. At r=3 m, find escape speed and state two assumptions.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $E_i + E_{in} = E_f + E_{out}$.
Account for energy across the system boundary. Conduction: matter interactions; convection: fluid motion; radiation: electromagnetic waves.

Worked reasoning: A metal rod transfers energy from its hot end toward its cool end by conduction. A circulating fluid can carry energy by convection; radiation can cross a vacuum.

Your turn: Draw one distinct, labeled model for each mechanism. Show the direction of energy transfer.

Marzano check - circle: ① ② ③

03 Represent and interpret

Classify: a metal spoon warming in soup; circulating water in a pot; sunlight warming your hand. Give a reason for each.

Marzano check - circle: ① ② ③

04 Solve and justify

A wall transfers energy at a supplied steady rate 40 W for 5 minutes. Find energy transferred. Explain why doubling thickness generally reduces conduction under otherwise matched conditions.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Conduction, convection, radiation

antocciphysics

Continue down each column.

05 Analyze the reasoning

An asteroid travels through nearly empty space. Which of these mechanisms can transfer thermal energy to it from sunlight? Why not ordinary air convection?

Marzano check - circle: 1 2 3

06 Choose a method

Supplied data: m=0.4 kg, drop h=0.6 m, final speed 2 m/s from rest, g=9.8. Find mgh, translational K and the fraction appearing as translation.

Marzano check - circle: 1 2 3

07 Exit check

A hot object in a vacuum still cools. Identify the transfer mechanism and explain whether absolute zero surroundings are required.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A vacuum flask still loses heat. Identify two paths that remain and propose measurements that distinguish them.

Marzano check - circle: 1 2 3
