Transfer: thermal energy

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose an energy-transfer model and communicate its limits.

SUCCESS CRITERIA - I can...

1. Distinguish warming, phase change and work.
2. Use correct signs and units.
3. Explain why a model result depends on its assumptions.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A heat engine absorbs Q_{hot}=2400 J and rejects Q_{cold}=1680 J each cycle. Find work and efficiency.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $Q = mc\Delta T$; $Q = mL$; $\Delta U = Q - W_{by}$; $\eta = W_{out}/Q_{hot}$. Select the applicable model and supplied constants. State heat-loss, phase-change and cycle assumptions.

Worked reasoning: A system takes 120 J of heat, does 50 J of work and increases internal energy by 70 J. An energy model must include transfers and storage rather than treating all heat as useful work.

Your turn: Draw its system boundary, input, output and storage change.

Marzano check - circle: ① ② ③

03 Represent and interpret

A hot block and cool water are isolated together. Draw initial heat flow and describe equilibrium without inventing a final temperature.

Hot block

Cool water

Each outline represents the labeled sample or container.

Marzano check - circle: ① ② ③

04 Solve and justify

A .10 kg ice sample at 0°C melts then warms to 10°C. Use L=334, 000 J/kg and water c=4200. Find total energy.

Marzano check - circle: ① ② ③

Transfer: thermal energy

antocciphysics

Continue down each column.

05 Analyze the reasoning

An engine absorbs 500 J and produces 150 J work in a cycle. Find rejected heat and explain why an energy balance alone does not establish that any temperature pair can achieve that efficiency.

Marzano check - circle: 1 2 3

06 Choose a method

A toy source has GM=288 m^3/s^2. At r=4 m, find escape speed and state two assumptions.

Marzano check - circle: 1 2 3

07 Exit check

A heat engine between 500 K and 300 K absorbs 1000 J. Find ideal maximum work and explain why actual work usually falls below it.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 0.5 kg sample with c=400 J/(kg·K) warms 2 K while doing 60 J of work on surroundings. Find heat input under $\Delta U = mc\Delta T$ and state one condition required for that model.

Marzano check - circle: 1 2 3
