Sound speed and resonance

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use travel time and resonant conditions to interpret sound.

SUCCESS CRITERIA - I can...

1. Account for round-trip distance in an echo.
2. Identify resonance as a response near a natural frequency.
3. Use an appropriate wavelength relationship.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use “echo” and “resonance” to explain your model or result. Sentence starters are optional.

echo: a sound received after reflection

resonance: a strong response near a system’s natural frequency

period: time for one complete cycle or orbit

01 Bring back an earlier idea

At fixed wave speed, frequency becomes 3 times as large. **Compare** wavelength and typical diffraction through the same opening.

Word help: diffraction = wave spreading around an edge or through an opening

Sentence starter: Both ... . They differ in ... because ... .

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $d_{echo} = v\Delta t/2$; v = 340 m/s.
Echo time is a round trip. Resonance occurs near a natural mode under suitable damping.

Worked reasoning: In an ideal tube open at both ends, the fundamental wavelength is twice its length. For L=0.5 m and sound speed 340 m/s, f=340/1=340 Hz.

Your turn: Sketch the fundamental with displacement antinodes at both ends.

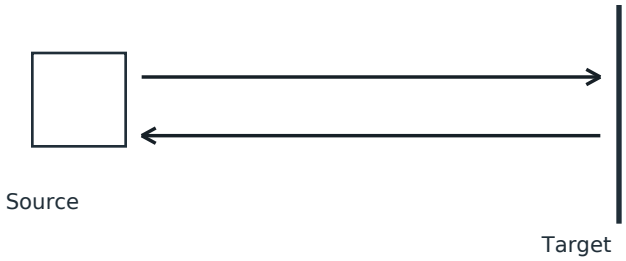

Sentence starter: The ... in my model represents ... . Its label shows ... .

Marzano check - circle: ① ② ③

03 Represent and interpret

An echo returns from a wall.
Draw the outgoing and returning path. Why does sound’s total travel distance exceed wall range?

Sentence starter: Under the assumption ..., the evidence ... supports ... because ... .

Marzano check - circle: ① ② ③

04 Solve and justify

A sound echo returns after .30 s in air.
Find wall range. An open-open pipe fundamental has length .50 m; findλ=2 L and f=v/λ.

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

Sound speed and resonance

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Analyze the reasoning

Why does a resonant response not mean that any object can respond strongly to every frequency?

Sentence starter: Under the assumption ..., the evidence ... supports ... because ... .

Marzano check - circle: 1 2 3

06 Choose a method

A heat engine absorbs Q_{hot}=3500 J and rejects Q_{cold}=2450 J each cycle.
Find work and efficiency.

Word help: efficiency = useful output divided by input

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: 1 2 3

07 Exit check

A closed-open pipe fundamental has L=.25 m. Useλ=4 L and v=340 to find frequency.

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A 0.85 m tube is closed at one end and open at the other. Usev=340 m/s andλ=4 L for its fundamental.
Find the first three allowed ideal resonance frequencies.

Word help: ideal = using stated simplifying conditions

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: 1 2 3
