The electromagnetic spectrum

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Relate electromagnetic wavelength, frequency and propagation.

SUCCESS CRITERIA - I can...

1. Use c=fλ in vacuum.
2. Order spectral regions by wavelength.
3. Distinguish electromagnetic from mechanical waves.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A closed-open pipe has length 0.3 m. Use λ=4 L for the fundamental and v=340 m/s. Find its fundamental frequency.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: c = fλ; c = 3.0×10⁸ m/s.
Electromagnetic waves in vacuum. Frequency identifies spectral region; mechanical sound needs a medium.

Worked reasoning: In vacuum, all electromagnetic waves travel at c=3×10⁸ m/s. A frequency of 10⁸ Hz gives wavelength 3 m. Higher frequency means shorter wavelength at the same speed.

Your turn: Draw two waves with a common speed but different wavelengths; label which has higher frequency.

Marzano check - circle: ① ② ③

03 Represent and interpret

Order radio, visible and X-rays from longest to shortest wavelength. Which has greatest frequency in vacuum?

Radio	IR	Visible	UV	X-ray

Label increasing frequency and wavelength.

Marzano check - circle: ① ② ③

04 Solve and justify

Find frequency of vacuum light withλ=600 nm. Use 1 nm=10⁻⁹ m. Then findλ for 100 MHz radio. Use 1 MHz=10⁶ Hz.

Marzano check - circle: ① ② ③

The electromagnetic spectrum

antocciphysics

Continue down each column.

05 Analyze the reasoning

Why can sunlight cross space but ordinary sound from a speaker cannot cross a vacuum?

Marzano check - circle: 1 2 3

06 Choose a method

A heat engine operates between 600 K and 400 K and absorbs 800 J. Find maximum ideal work and explain why actual work is usually lower.

Marzano check - circle: 1 2 3

07 Exit check

A wave has $f = 2.4 \times 10^{9}$ Hz in vacuum. Find λ. Identify the spectral region.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Visible light has wavelength 600 nm. Find frequency using $1\ \text{nm} = 10^{-9}$ m. Compare with light of wavelength 300 nm.

Marzano check - circle: 1 2 3
