Transfer: waves and signals

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Choose appropriate wave models and explain what a signal establishes.

SUCCESS CRITERIA - I can...

1. Use wave speed and round-trip geometry correctly.
2. Separate frequency, amplitude and direction effects.
3. State the limits of an inference from a signal.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Two targets each have range 500 m but different radial velocities. Explain how they can have equal echo delays yet different Doppler shifts.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $v = f\lambda$; $T = 1/f$; $d_{range} = v\Delta t/2$.
d_{range} is one-way range from round-trip time. Match speed and model to the wave and medium.

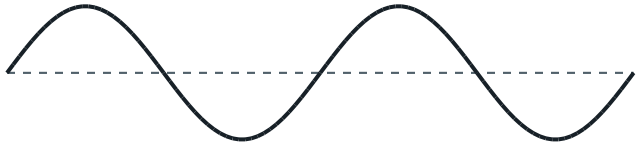

Worked reasoning: An echo time measures range using travel speed, while a frequency shift can indicate radial motion. Different observations answer different questions about the same target.

Your turn: Draw a measurement plan labeling outgoing pulse, return pulse and the time interval.

Marzano check - circle: ① ② ③

03 Represent and interpret

Sketch a wave and label amplitude and wavelength. Explain which tells about oscillation size and which about spatial repetition.

Sketch and label your response.

Marzano check - circle: ① ② ③

04 Solve and justify

A radar echo returns after .012 s. Use $c=3\times10^8$ m/s. Find range. Then find$\lambda$for $f=3\times10^9$ Hz in vacuum.

Marzano check - circle: ① ② ③

Transfer: waves and signals

antocciphysics

Continue down each column.

05 Analyze the reasoning

A source gets louder while its frequency remains fixed. Does pitch necessarily rise? Explain using wave properties.

Marzano check - circle: 1 2 3

06 Choose a method

At fixed wave speed, frequency becomes 4 times as large. Compare wavelength and typical diffraction through the same opening.

Marzano check - circle: 1 2 3

07 Exit check

An ideal blackbody temperature doubles while a sound source frequency doubles. These are separate cases. Compare each wavelength change under its appropriate assumptions.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A stationary radar measures echoes at 10.0 and 9.6 microseconds separated by 0.2 s. Find both ranges and average radial velocity; distinguish this from the propagation speed.

Marzano check - circle: 1 2 3
