Charge and the electric car

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain charge interactions and trace an electric car's energy transfers.

SUCCESS CRITERIA - I can...

1. Predict attraction or repulsion from charge signs.
2. Distinguish charge from energy.
3. Trace energy from a battery to moving wheels.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use "charge" and "circuit" to explain your model or result. Sentence starters are optional.

charge: a property responsible for electric interactions

circuit: a connected arrangement of electrical components

motor: a device converting electrical energy to mechanical output

01 Bring back an earlier idea

An ideal blackbody has peak wavelength 966.7 nm.
Use $\lambda_{max}\,T = 2.90\times10^{6}$ nm·K.
Estimate temperature.

Word help: blackbody = an ideal absorber/emitter used in a thermal-radiation model

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $E_{electrical} = E_{mechanical} + E_{thermal}$ + other transfers. Energy accounting for a motor with no net energy storage. A battery transfers energy; charge already exists in the wires.

Worked reasoning: Rubbing can transfer electrons between materials. If one isolated object gains charge -3 units and another loses the same electrons, their charge changes add to zero.

Your turn: Draw before-and-after charge accounts for both objects. Distinguish transfer from creation of charge.

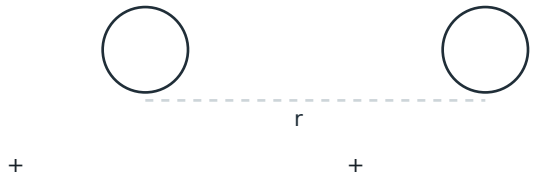

Sentence starter: The ... in my model represents ... . Its label shows ... .

Marzano check - circle: ① ② ③

03 Represent and interpret

Draw force arrows for two positive charges, then for a positive and a negative charge.

Sentence starter: The ... in my model represents ... . Its label shows ... .

Each circle represents one of the labeled objects or charges; r is their center-to-center separation.

Marzano check - circle: ① ② ③

04 Solve and justify

A battery transfers 120 J while the moving car gains 30 J kinetic energy. If it stays at the same height, how much energy enters other forms?
Explain why charge is not used up.

Sentence starter: Under the assumption ..., the evidence ... supports ... because ... .

Marzano check - circle: ① ② ③

Charge and the electric car

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Analyze the reasoning

A student says the motor uses up the current so less returns to the battery.
Explain the mistake for a steady series circuit.

Sentence starter: The step I would change is … . The evidence is … .

Marzano check - circle: 1 2 3

06 Choose a method

Three instantaneous displacements are +4 mm, -6 mm and -8 mm.
Find their sum and explain why one displacement value does not determine total wave energy.

Word help: displacement = change from initial position to final position, with direction

Sentence starter: Under the assumption …, the evidence … supports … because … .

Marzano check - circle: 1 2 3

07 Exit check

How can an initially neutral object be attracted to a charged object without having a net charge?

Sentence starter: I notice … . This supports … because … .

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

An initially neutral pair separates with charges +8 nC and -8 nC. One then shares all its net charge equally with an identical initially neutral conductor.
Find the three final charges.

Sentence starter: I found … [unit]. This value means … in this situation.

Marzano check - circle: 1 2 3
