Electromagnetic induction

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Explain why changing magnetic flux can induce an emf.

SUCCESS CRITERIA - I can...

1. Identify a change in magnetic flux.
2. Predict whether a stationary arrangement produces sustained induction.
3. Use Lenz's law to describe opposition to change.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

LANGUAGE GOAL Use "induction" and "flux" to explain your model or result. Sentence starters are optional.

induction: producing an emf through a changing magnetic flux

flux: a measure of magnetic field passing through a chosen area

emf: energy supplied per charge, measured in volts

01 Bring back an earlier idea

A 3 Ω resistor carries 5 A.
Find power using both IV and I^2R, showing the implied voltage.

Word help: voltage = electric potential difference; energy transferred per charge

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $\Phi = BA$; $|emf_{avg}| = N|\Delta\Phi|/\Delta t$.
Uniform perpendicular field for $\Phi = BA$. N is coil turns; the induced effect opposes the flux change.

Worked reasoning: A changing magnetic flux through a coil can induce voltage. Holding a magnet stationary relative to a fixed coil gives no induction from relative motion in this simple setup.

Your turn: Draw a magnet approaching a coil and mark the changing field through the loop. Contrast it with a stationary case.

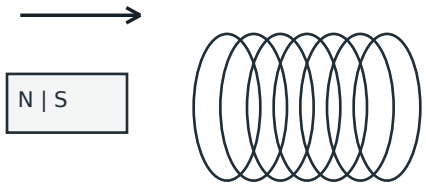

Sentence starter: The ... in my model represents ... . Its label shows ... .

Marzano check - circle: ① ② ③

03 Represent and interpret

Compare a magnet held still beside a fixed coil with a magnet moving into the coil. Which can produce a changing flux?

Sentence starter: Both ... . They differ in ... because ... .

Coil

Marzano check - circle: ① ② ③

04 Solve and justify

A 100-turn coil has area .020 m^2. A uniform perpendicular field changes from .10 T to .30 T in .50 s.
Find average emf magnitude.

Word help: uniform = constant throughout the stated interval

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: ① ② ③

Electromagnetic induction

antocciphysics

Continue down each column.

Sentence starters are optional. You may plan in any language.

05 Analyze the reasoning

Why does Lenz’s law oppose the change in flux rather than always oppose the field itself?

Sentence starter: Under the assumption ..., the evidence ... supports ... because ... .

Marzano check - circle: 1 2 3

06 Choose a method

Both charge magnitudes become 4 times as large and separation becomes 6 times as large. Express new force as a fraction of the old.

Word help: separation = distance between the specified objects or centers

Sentence starter: I notice ... . This supports ... because ... .

Marzano check - circle: 1 2 3

07 Exit check

The same flux change occurs in one fourth the time. **Compare** emf magnitude and name a model assumption.

Word help: magnitude = size of a quantity without its direction

Sentence starter: Both ... . They differ in ... because ... .

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

Flux per turn changes from 0.01 to 0.04 Wb in 0.2 s through 50 turns.
Find average emf magnitude and describe Lenz's-law direction qualitatively.

Word help: magnitude = size of a quantity without its direction

Sentence starter: I found ... [unit]. This value means ... in this situation.

Marzano check - circle: 1 2 3

Read down the left column, then down the right. Use the open space to draw, calculate and explain.
