Motors and generators

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Distinguish electrical-to-mechanical transfer from mechanical-to-electrical transfer.

SUCCESS CRITERIA - I can...

1. Trace energy through a motor and a generator.
2. Identify magnetic interactions in rotation or induction.
3. Include less useful energy transfers.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

A bar magnet is cut into 3 pieces. Does this produce isolated north and south poles? Sketch the usual result.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $\eta = P_{useful}/P_{input}$; $E_{input} = E_{useful} + E_{losses}$. Motor: electrical to mechanical; generator: mechanical to electrical. Count losses and any stored-energy change.

Worked reasoning: An idealized motor receives 20 J electrically and delivers 12 J mechanically; 8 J goes to other transfers. A generator runs the energy conversion in the opposite useful direction.

Your turn: Draw separate motor and generator energy-flow diagrams.

Marzano check - circle: ① ② ③

03 Represent and interpret

Complete two energy chains: battery → motor → turning axle, and turning axle → generator → lamp. Label each input and useful output.

Marzano check - circle: ① ② ③

04 Solve and justify

A generator receives 50 W mechanical power and supplies 12 V at 3 A. Find useful electrical power, efficiency and loss rate.

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

05 Analyze the reasoning

A motor drives a generator that feeds the motor. Explain why real losses prevent the loop from running forever without external input.

Marzano check - circle: 1 2 3

06 Choose a method

Move from r to 4 r away from a point charge. Compare field magnitude and state the source model assumption.

Marzano check - circle: 1 2 3

07 Exit check

A motor is 80% efficient and a generator is 75% efficient. Find their combined useful fraction in sequence.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A motor receives 24 W and operates at 75% efficiency. It lifts a 3 kg load at steady speed withg=10. Find the speed and wasted power.

Marzano check - circle: 1 2 3
