Magnetosphere and changing fields

antocciphysics

Name: _____ **Block:** _____ (teacher only) **Mastery Rating:** _____

LEARNING TARGET Use evidence to distinguish a magnetic-field model from an unsupported space-weather claim.

SUCCESS CRITERIA - I can...

1. Connect changing magnetic fields with induced electric effects.
2. Distinguish an assumption from an observation.
3. Name evidence required for a space-weather prediction.

Core: teacher selects from 1-7. **Stretch:** 8 after checking your work.

MARZANO SELF-CHECK

① Need help starting

② Can do part; need help

③ Solve and explain with allowed supports

01 Bring back an earlier idea

Near an ideal long straight wire, current becomes 3 times as large and distance becomes 5 times as large. Compare B.

Marzano check - circle: ① ② ③

02 Explain a worked example

Reference: $|\text{emf}_{avg}| = N|\Delta\Phi|/\Delta t$; $\Phi = BA$.
Uniform perpendicular field for $\Phi = BA$. Use supplied/measured field changes; an asteroid alone is not evidence of an electromagnetic pulse.

Worked reasoning: A changing magnetic environment can induce voltages in conducting loops. A static magnetic field alone is not the same as a changing flux through a particular circuit.

Your turn: Sketch a conducting loop and field arrows; show one way flux can change.

Marzano check - circle: ① ② ③

03 Represent and interpret

Draw a coil in a changing magnetic field. Label what changes and where an induced emf could appear.

Marzano check - circle: ① ② ③

04 Solve and justify

A hypothetical 10-turn loop of area 5 m^2 experiences a perpendicular field change of 2×10^{-6} T in 7 s. Find average emf. Does the calculation show an asteroid caused the change?

Marzano check - circle: ① ② ③

Read down the left column, then down the right. Use the open space to draw, calculate and explain.

Magnetosphere and changing fields

antocciphysics

Continue down each column.

05 Analyze the reasoning

A headline claims an approaching rock will disable power grids through an EMP, but gives no field measurements or mechanism. Name two pieces of evidence needed before accepting it.

Marzano check - circle: 1 2 3

06 Choose a method

Two series components have drops 4 V and 6 V. A charge of 8 C passes through each. Find each energy transfer and the total.

Marzano check - circle: 1 2 3

07 Exit check

Explain why a one-loop calculation cannot by itself predict effects on a whole power grid.

Marzano check - circle: 1 2 3

08 STRETCH: Apply it another way

A one-turn 100 m² loop is perpendicular to a uniform field that changes by 2 microtesla in 0.5 s. Estimate emf. Explain why this toy result is not a full forecast for a power grid.

Marzano check - circle: 1 2 3
